

Very long baselines with a superbeam

Milind Diwan

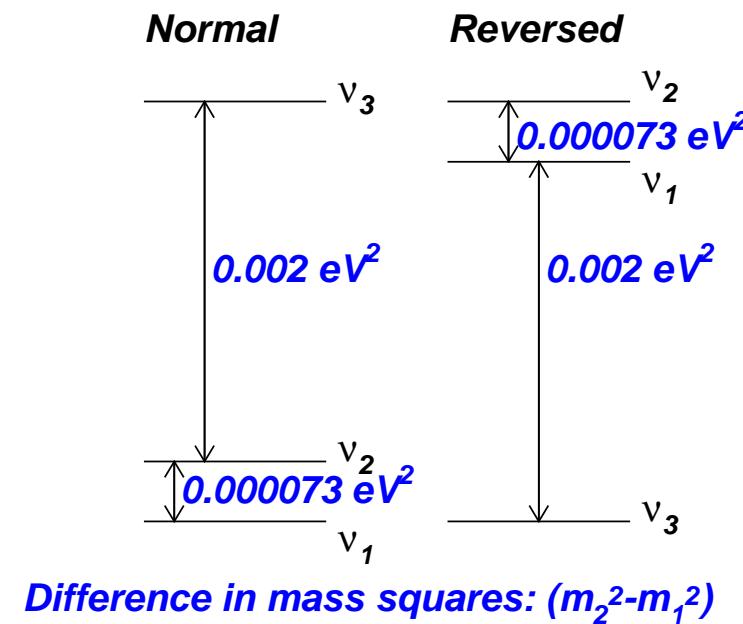

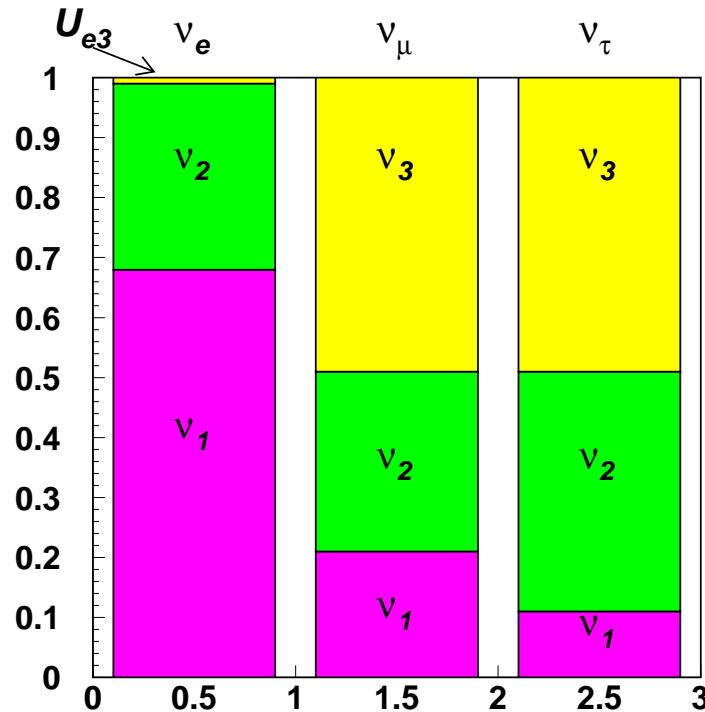

FOR BNL Neutrino Working Group.

December 1, 2003

University of California, Los Angeles

Wide Band Conventional Beam from BNL to the
Homestake Laboratory.

Big Picture

Very long baselines with a superbeam

Neutrino Physics so far

- Evidence for Neutrino flavor change
 - Atmospheric neutrinos: SuperK
 - Solar: SNO, All previous radio-chemical measurements.
 - KamLAND: Confirm the solar LMA solution.
 - Limits on parameters from many accelerator and reactor exp.
 - LSND: To be addressed by mini-boone.
- Direct Neutrino mass
 - Oscillations: Neutrinos definitely have mass.
 - Tritium beta-decay: < 2.8 eV.
 - Double beta decay: mass < 0.3 eV if Majorana.
 - Astrophysics: Large Scale Structure < 1 eV.
- Number of Neutrinos
 - Z width: 2.981 ± 0.008 active types
 - Limits on sterile neutrinos from solar, atmospheric results.
 - Big Bang Nucleosynthesis: 3 active neutrinos.

Neutrino Physics: Oscillations

Assume a 2×2 neutrino mixing matrix.

$$\begin{pmatrix} \nu_a \\ \nu_b \end{pmatrix} = \begin{pmatrix} \cos(\theta) & \sin(\theta) \\ -\sin(\theta) & \cos(\theta) \end{pmatrix} \begin{pmatrix} \nu_1 \\ \nu_2 \end{pmatrix} \quad (1)$$

$$\begin{aligned} \nu_a(t) &= \cos(\theta)\nu_1(t) + \sin(\theta)\nu_2(t) \\ P(\nu_a \rightarrow \nu_b) &= |<\nu_b|\nu_a(t)>|^2 \\ &= \sin^2(\theta)\cos^2(\theta)|e^{-iE_2t} - e^{-iE_1t}|^2 \end{aligned} \quad (2)$$

Sufficient to understand most of the physics:

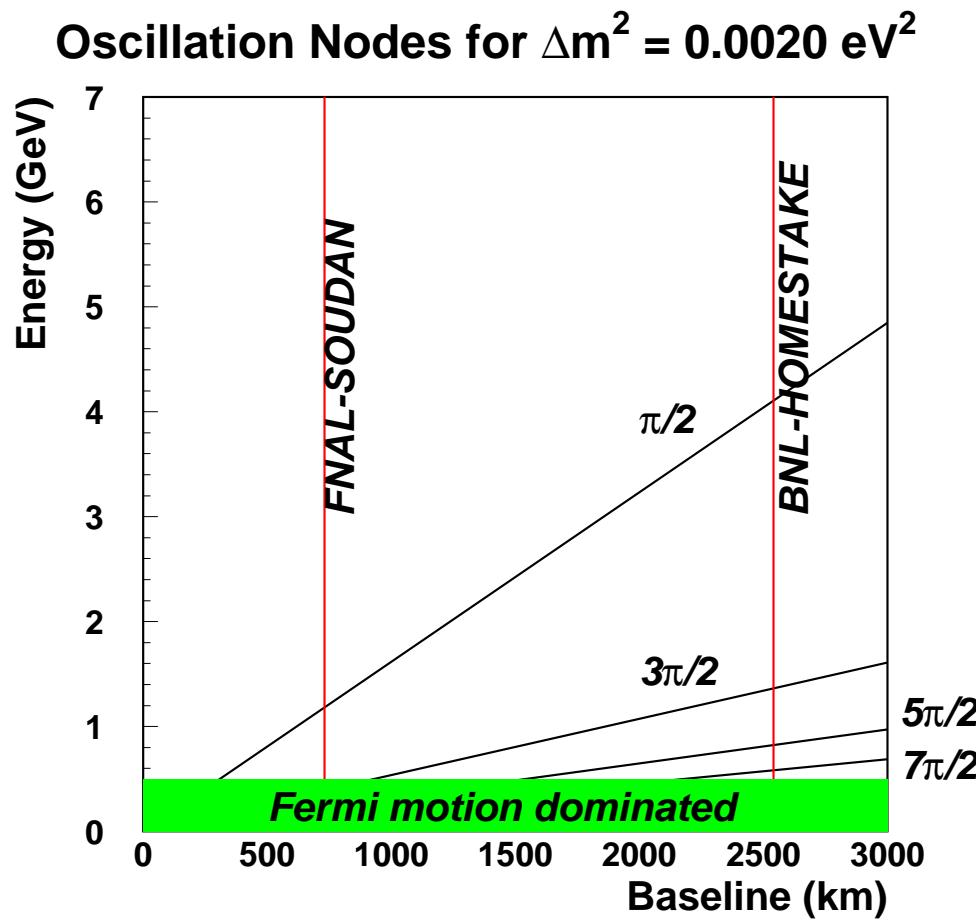

$$P(\nu_a \rightarrow \nu_b) = \sin^2 2\theta \sin^2 \frac{1.27((m_2^2 - m_1^2)/eV^2)(L/km)}{(E/GeV)}$$

$$P(\nu_a \rightarrow \nu_a) = 1 - \sin^2 2\theta \sin^2 \frac{1.27(\Delta m^2/eV^2)(L/km)}{(E/GeV)}$$

Oscillation nodes at $\pi/2, 3\pi/2, 5\pi/2, \dots (\pi/2)$:
 $\Delta m^2 = 0.002eV^2$, $E = 1GeV$, $L = 618km$.

Very long baselines with a superbeam

Matter Effect

- Large effects: Multiple oscillation nodes.
- Low cross section at low energies
- Fermi motion limits resolution at low energies: wide band beam ($0.5 \rightarrow 8 \text{ GeV}$).
- $\Delta m^2 \approx 0.002 \text{ eV}^2$: Baseline $> 2000 \text{ km}$.

Neutrino Physics: 3×3 Formulation

Bill Marciano, hep-ph/0108181

$$\begin{pmatrix} \nu_e \\ \nu_\mu \\ \nu_\tau \end{pmatrix} = \begin{pmatrix} U_{e1} & U_{e2} & U_{e3} \\ U_{\mu 1} & U_{\mu 2} & U_{\mu 3} \\ U_{\tau 1} & U_{\tau 2} & U_{\tau 3} \end{pmatrix} \begin{pmatrix} \nu_1 \\ \nu_2 \\ \nu_3 \end{pmatrix} \quad (3)$$

$$\begin{pmatrix} \nu_e \\ \nu_\mu \\ \nu_\tau \end{pmatrix} = \begin{pmatrix} c_{12}c_{13} & s_{12}c_{13} & s_{13}e^{-i\delta} \\ -s_{12}c_{23} - c_{12}s_{23}s_{13}e^{i\delta} & c_{12}c_{23} - s_{12}s_{23}s_{13}e^{i\delta} & s_{23}c_{13} \\ s_{12}s_{23} - c_{12}c_{23}s_{13}e^{i\delta} & -c_{12}s_{23} - s_{12}c_{23}s_{13}e^{i\delta} & c_{23}c_{13} \end{pmatrix} \begin{pmatrix} \nu_1 \\ \nu_2 \\ \nu_3 \end{pmatrix} \quad (4)$$

Very long baselines with a superbeam

Neutrino Physics: the difficult stuff

$$\begin{aligned}
 P(\nu_\mu \rightarrow \nu_e) = & 4(s_2^2 s_3^2 c_3^2 + J_{CP} \sin \Delta_{21}) \sin^2 \frac{\Delta_{31}}{2} \\
 & + 2(s_1 s_2 s_3 c_1 c_2 c_3^2 \cos \delta - s_1^2 s_2^2 s_3^2 c_3^2) \sin \Delta_{31} \sin \Delta_{21} \\
 & + 4(s_1^2 c_1^2 c_2^2 c_3^2 + s_1^4 s_2^2 s_3^2 c_3^2 - 2s_1^3 s_2 s_3 c_1 c_2 c_3^2 \cos \delta) \\
 & \quad - J_{CP} \sin \Delta_{31}) \sin^2 \frac{\Delta_{21}}{2} \\
 & + 8(s_1 s_2 s_3 c_1 c_2 c_3^2 \cos \delta - s_1^2 s_2^2 s_3^2 c_3^2) \sin^2 \frac{\Delta_{31}}{2} \sin^2 \frac{\Delta_{21}}{2}
 \end{aligned} \tag{5}$$

No matter effects in above formula

$$\Delta_{31} \equiv \Delta m_{31}^2 L / 2E_\nu$$

$$\Delta_{21} \equiv \Delta m_{21}^2 L / 2E_\nu$$

$$J_{CP} \equiv s_1 s_2 s_3 c_1 c_2 c_3^2 \sin \delta \quad (6)$$

$$A \equiv \frac{P(\nu_\mu \rightarrow \nu_e) - P(\bar{\nu}_\mu \rightarrow \bar{\nu}_e)}{P(\nu_\mu \rightarrow \nu_e) + P(\bar{\nu}_\mu \rightarrow \bar{\nu}_e)} \quad (7)$$

To leading order in Δ_{21} (assumed to be small), one finds

$$\begin{aligned} P(\nu_\mu \rightarrow \nu_e) &\simeq 4s_2^2 s_3^2 c_3^2 \sin^2 \frac{\Delta_{31}}{2} + \mathcal{O}(\Delta_{21}) \\ A &\simeq \frac{J_{CP} \sin \Delta_{21}}{s_2^2 s_3^2 c_3^2} \simeq \frac{2s_1 c_1 c_2 \sin \delta}{s_2 s_3} \left(\frac{\Delta m_{21}^2}{\Delta m_{31}^2} \right) \frac{\Delta m_{31}^2 L}{4E_\nu} + \mathcal{O}(\Delta_{21}^2) \end{aligned}$$

$\nu_\mu \rightarrow \nu_e$ with matter effect

Approximate formula (Lindener, Huber et al.)

$$\begin{aligned}
 P(\nu_\mu \rightarrow \nu_e) \approx & \sin^2 \theta_{23} \frac{\sin^2 2\theta_{13}}{(\hat{A} - 1)^2} \sin^2((\hat{A} - 1)\Delta) \\
 & + \alpha \frac{8J_{CP}}{\hat{A}(1 - \hat{A})} \sin(\Delta) \sin(\hat{A}\Delta) \sin((1 - \hat{A})\Delta) \\
 & + \alpha \frac{8I_{CP}}{\hat{A}(1 - \hat{A})} \sin(\Delta) \cos(\hat{A}\Delta) \sin((1 - \hat{A})\Delta) \\
 & + \alpha^2 \frac{\cos^2 \theta_{23} \sin^2 2\theta_{12}}{\hat{A}^2} \sin^2(\hat{A}\Delta)
 \end{aligned} \tag{8}$$

$$J_{CP} = 1/8 \sin \delta_{CP} \cos \theta_{13} \sin 2\theta_{12} \sin 2\theta_{13} \sin 2\theta_{23}$$

$$I_{CP} = 1/8 \cos \delta_{CP} \cos \theta_{13} \sin 2\theta_{12} \sin 2\theta_{13} \sin 2\theta_{23}$$

$$\alpha = \Delta m_{21}^2 / \Delta m_{31}^2, \Delta = \Delta m_{31}^2 L / 4E$$

$$\hat{A} = 2VE / \Delta m_{31}^2$$

Comments about matter effect

$V = \sqrt{2}G_F n_e$. n_e is the density of electrons in the Earth.

$$\hat{A} \approx 7.6 \times 10^{-5} \times (D/gm/cm^3) \times (E_\nu/GeV)/(\Delta m_{31}^2/eV^2),$$

Also recall $\Delta m_{31}^2 = \Delta m_{32}^2 + \Delta m_{21}^2$.

- This is a very approximate equation, not applicable below the first maximum.
- First term has the effect of $\sin^2 2\theta_{13}$ and matter.
- Second and third terms have effects of CP.
- Term with J_{CP} changes sign for $(Anti - \nu_\mu) \rightarrow (Anti - \nu_e)$
- Last term is almost independent of Δm_{31}^2 and is purely dominated by the solar Δm_{21}^2

Some Observations

If performing an appearance experiment ($\nu_\mu \rightarrow \nu_e$) or ($\nu_e \rightarrow \nu_\mu$) around $\pi/2$ node then

- a) Difficult to avoid matter effect at accelerator energies.
- b) Any reasonable accelerator based experimental setup has sizable contribution from all 4 effects

Matter effect or mass hierarchy

$$\theta_{13}$$

$$\delta_{CP}$$

$$\Delta m_{21}^2$$

- c) To disentangle must have several data points on the oscillation curve (different L or E).

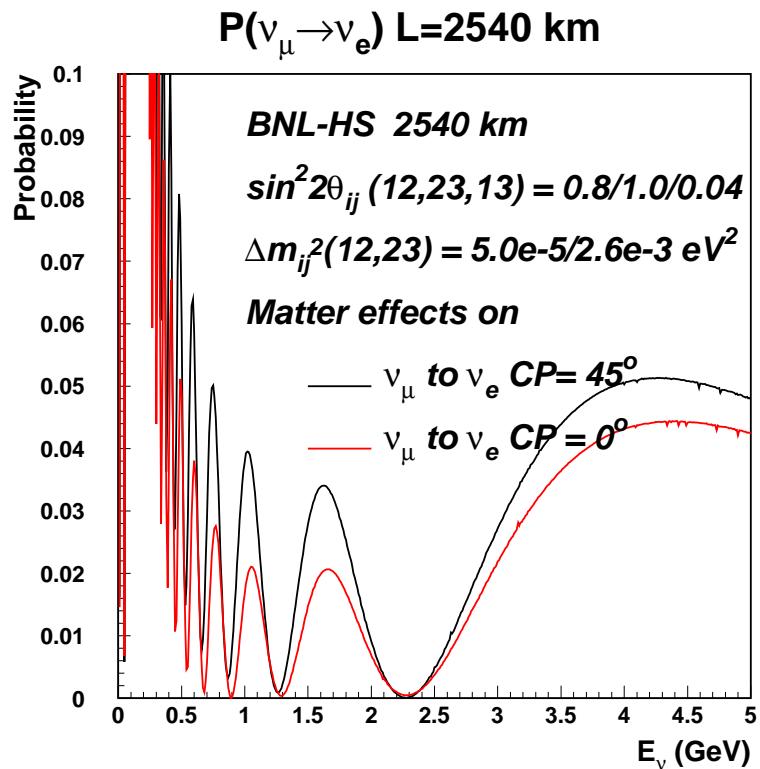

Scaling Laws for CP Measurement

Effect of δ_{CP} compared to first term in appearance.

$R_{CP} \equiv$ Second term divided by First Term.

$$R_{CP} \propto \sin \delta_{CP} \frac{\Delta m_{21}^2 L}{4E} \frac{1}{\sin 2\theta_{13}}$$

- $R_{CP} \propto 1/E$. Matter effect only at high E .
Allows separation of matter effect and CP effect.
- $R_{CP} \propto L$. Event rate $\propto 1/L^2$.
Statistical merit indep. of L for same sized detector.
- $R_{CP} \propto 1/\sin 2\theta_{13}$. Electron event rate $\propto \sin^2 2\theta_{13}$.
Statistical merit indep. of θ_{13} .
- $R_{CP} \propto \Delta m_{21}^2$. Better CP resolution for higher Δm_{21}^2 .
- For given resolution on δ_{CP} detector size is independent of L.

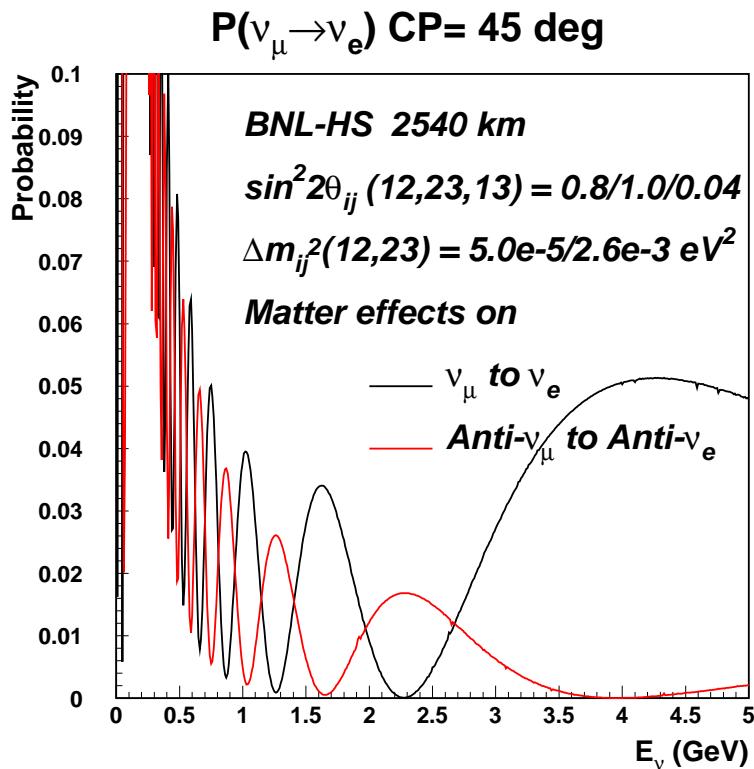

General Features

- 0.5 – 1 GeV: Δm_{12}^2 (LMA) region.
- 1 – 3 GeV: CP large effects region
- > 3 GeV: Matter enhanced (ν_μ), suppressed ($\bar{\nu}_\mu$). ($\Delta m_{32}^2 > 0$) Region.

Exact numerical calculation

e.g. I. Mocioiu and R. Shrock, Phys. Rev. D62, 053017 (2000),
JHEP 0111, 050 (2001)

Compare Neutrino to Antineu.

- 0.5 – 1 GeV: Δm_{12}^2 (LMA) region.
- 1 – 3 GeV: CP region
- > 3 GeV: Matter enhanced (ν_μ), suppressed ($\bar{\nu}_\mu$). ($\Delta m_{32}^2 > 0$) Region.

4 GOALS OF NEUTRINO OSCILLATION PHYSICS

- Precise determination of Δm_{32}^2 and $\sin^2 2\theta_{23}$ and definitive observation of oscillatory behavior.
- Detection of $\nu_\mu \rightarrow \nu_e$ in the appearance mode. If $\Delta m_{\nu_\mu \rightarrow \nu_e}^2 = \Delta m_{32}^2$ then $|U_{e3}|^2 (= \sin^2 \theta_{13})$ is non-zero.
- Detection of the matter enhancement effect in $\nu_\mu \rightarrow \nu_e$. Sign of Δm_{32}^2 ; i.e. which neutrino is heavier.
- Detection of CP violation in neutrino physics. Phase of $|U_{e3}|$ is CP violating and causes asymmetry in the rates $\nu_\mu \rightarrow \nu_e$ versus $\bar{\nu}_\mu \rightarrow \bar{\nu}_e$.

It will be good to do it all in same experiment with only neutrino beam (no antineutrino).

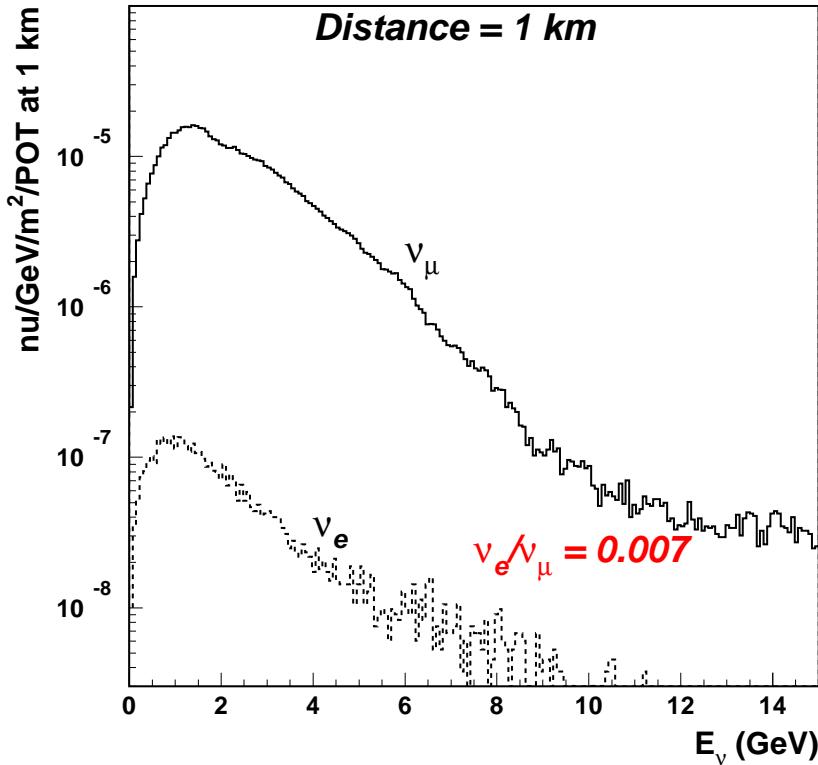

Summary of our study

- Baseline of > 2000 km with wide band conventional beams are the next step in accelerator neutrino physics.
- Extraordinary, large physical effects will be seen in such an experiment.
- Very good sensitivity to neutrino properties.
 - $< 1\%$ resolution on Δm_{32}^2
 - $< 1\%$ resolution on $\sin^2 2\theta_{23}$
 - Sensitivity to $\sin^2 2\theta_{13} > 0.005$ over a wide range of Δm_{32}^2
 - Sensitivity to CP violation.
 - Sign of Δm_{32}^2 over a wide range of parameters.
 - Measurement of Δm_{21}^2 in LMA region.
- Requires new thinking on how to build a beam and a detector. But experiment is technically feasible.

Comments

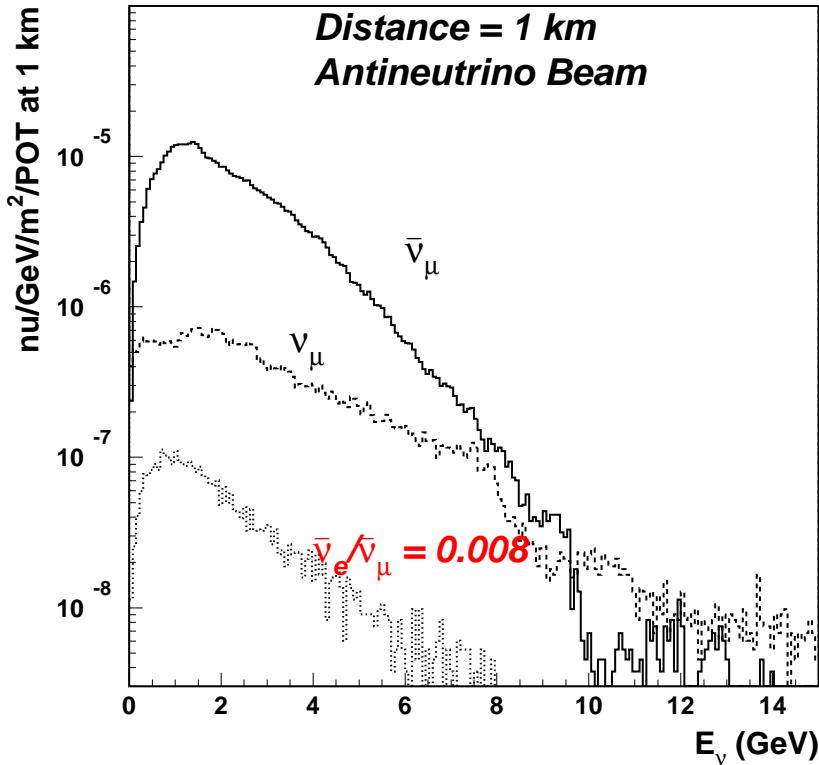

- Important ideas here are:
 - Long baseline to achieve large effects
 - Low energy wide band beam to get spectra
 - Beam is wide band, but low energy to make low backgrounds to ν_e appearance signature.
- Important difference between quark-matrix and neutrino-matrix
 - Neutrino oscillation effects are exactly calculable for any given set of parameters.
(including matter)
 - For quarks we often need complex tools such as CHPT and Lattice to connect CKM-matrix to physical phenomena.
- It makes sense to make a neutrino oscillation experiment with large effects even if they are sensitive to multiple parameters.

BNL Wide Band. Proton Energy = 28 GeV

- New design spans 0.5-6 GeV
- Low ν_e background 0.7%
 0.0073 ± 0.0014 (E734 1986).
- Low background from high energies (NC and ν_τ for ν_e)
- 200 m decay tunnel
- Graphite target embedded in horn
- Target cooling achievable for 1 MW

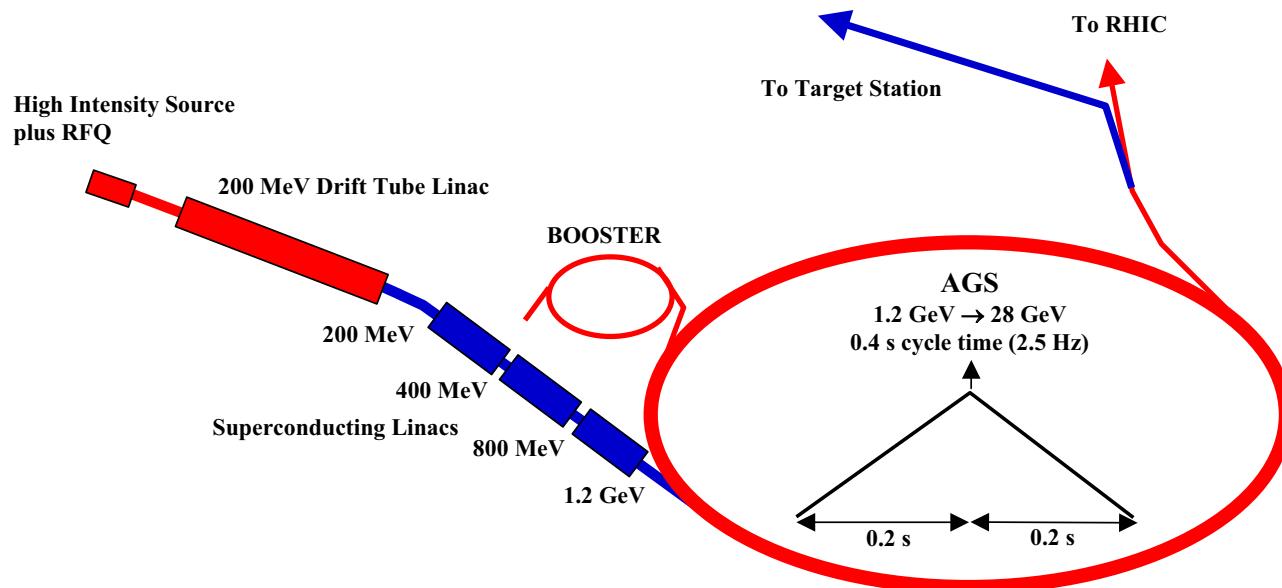

BNL Wide Band. Proton Energy = 28 GeV

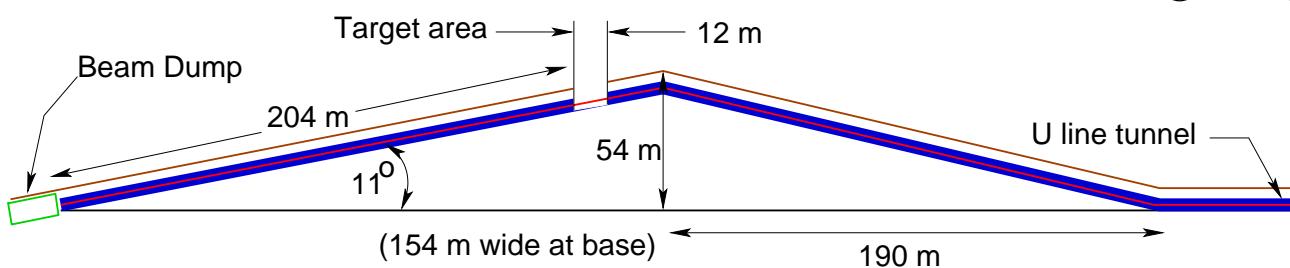

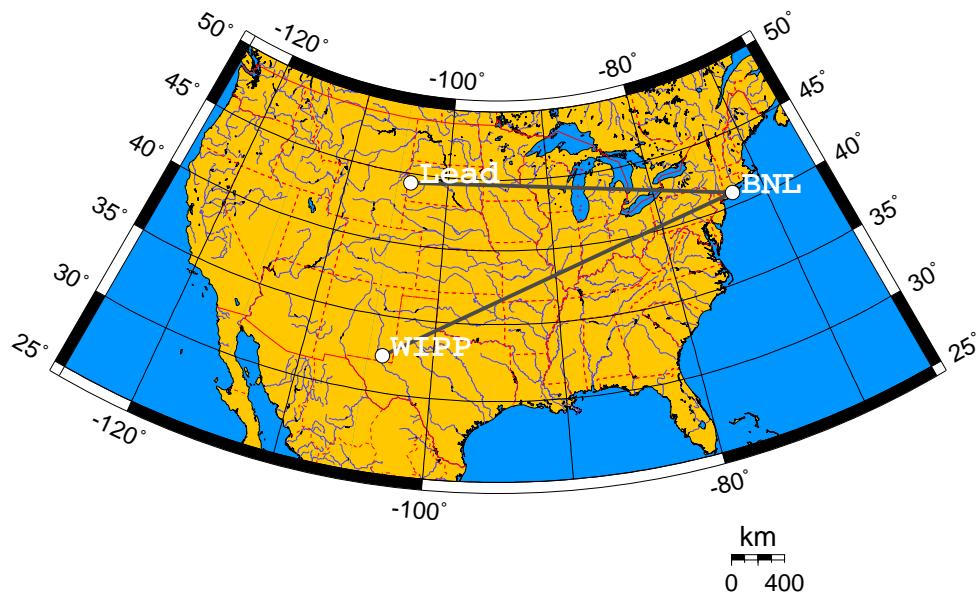

- Antineutrino beam has larger neutrino contamination.
- Will need to go to 2 MW to get statistics equal to neutrino.

The Accelerator

- Conceptually simple upgrade. No magic.
- Run 28 GeV AGS at 2.5 Hz to get 1 MW.
- Need faster proton source: Super Conducting LINAC at 1.2 GeV
- Current: $7 \times 10^{13} ppp$ at 0.5 Hz => LINAC: $10^{14} ppp$ at 2.5 Hz.

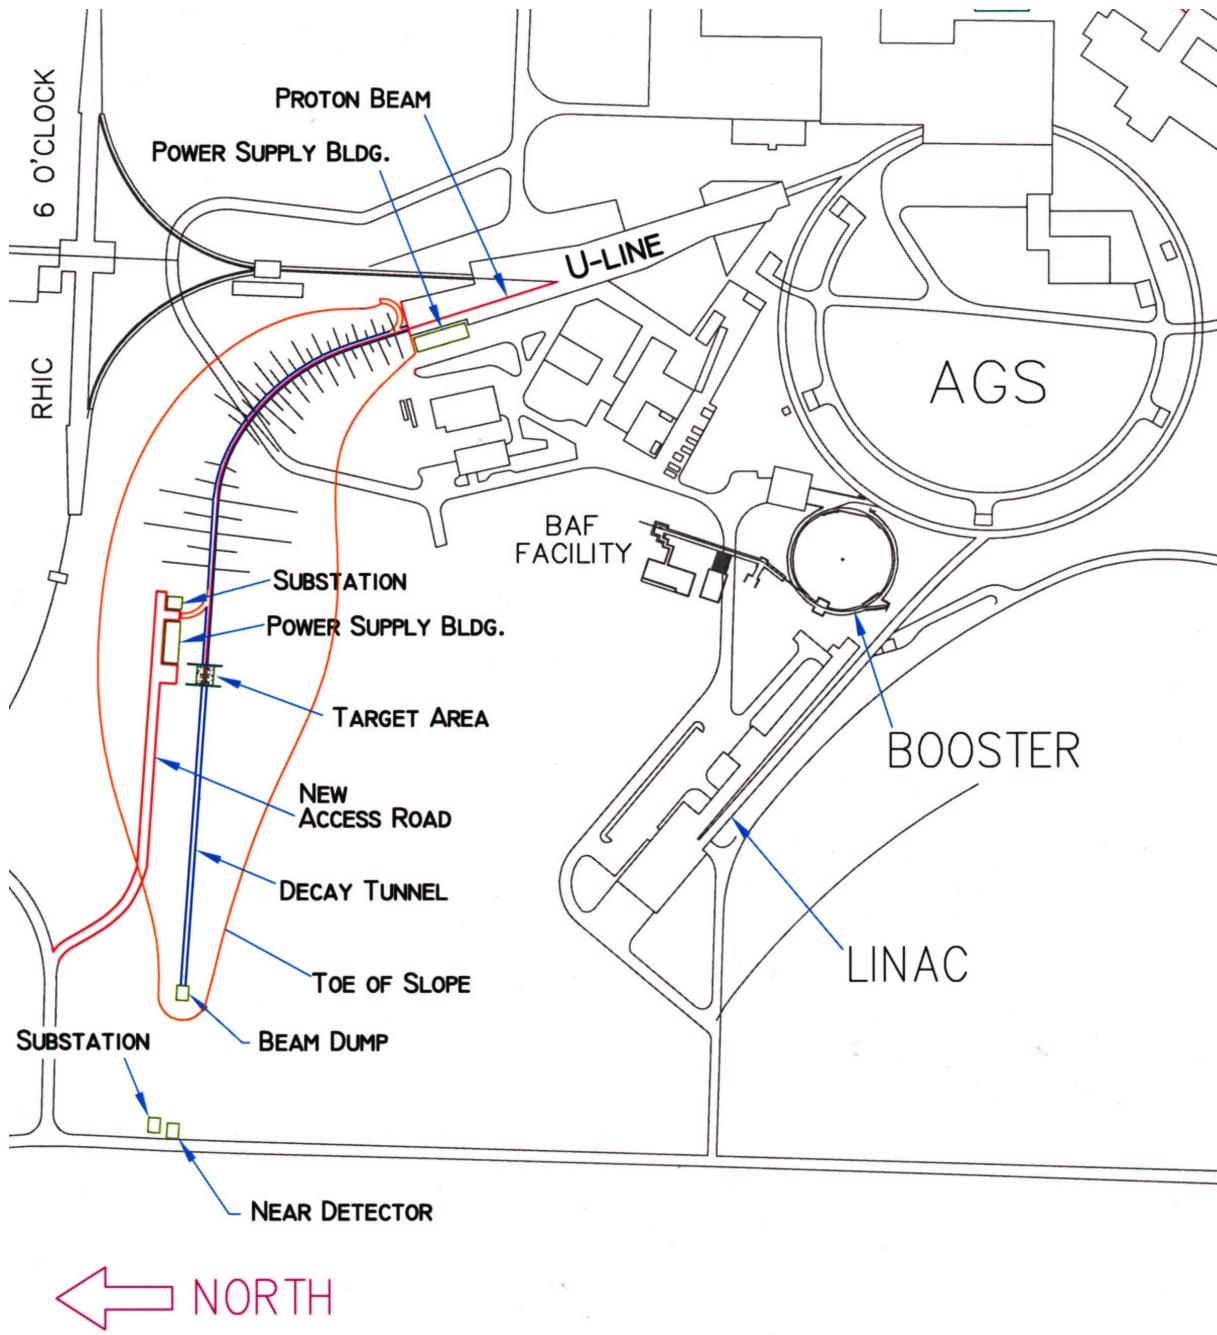

Beam on the Hill

- BNL-Lead 2540km
BNL-Wipp: 2880km
- Avoids water table.
- Hills are inexpensive:
highway ramps.

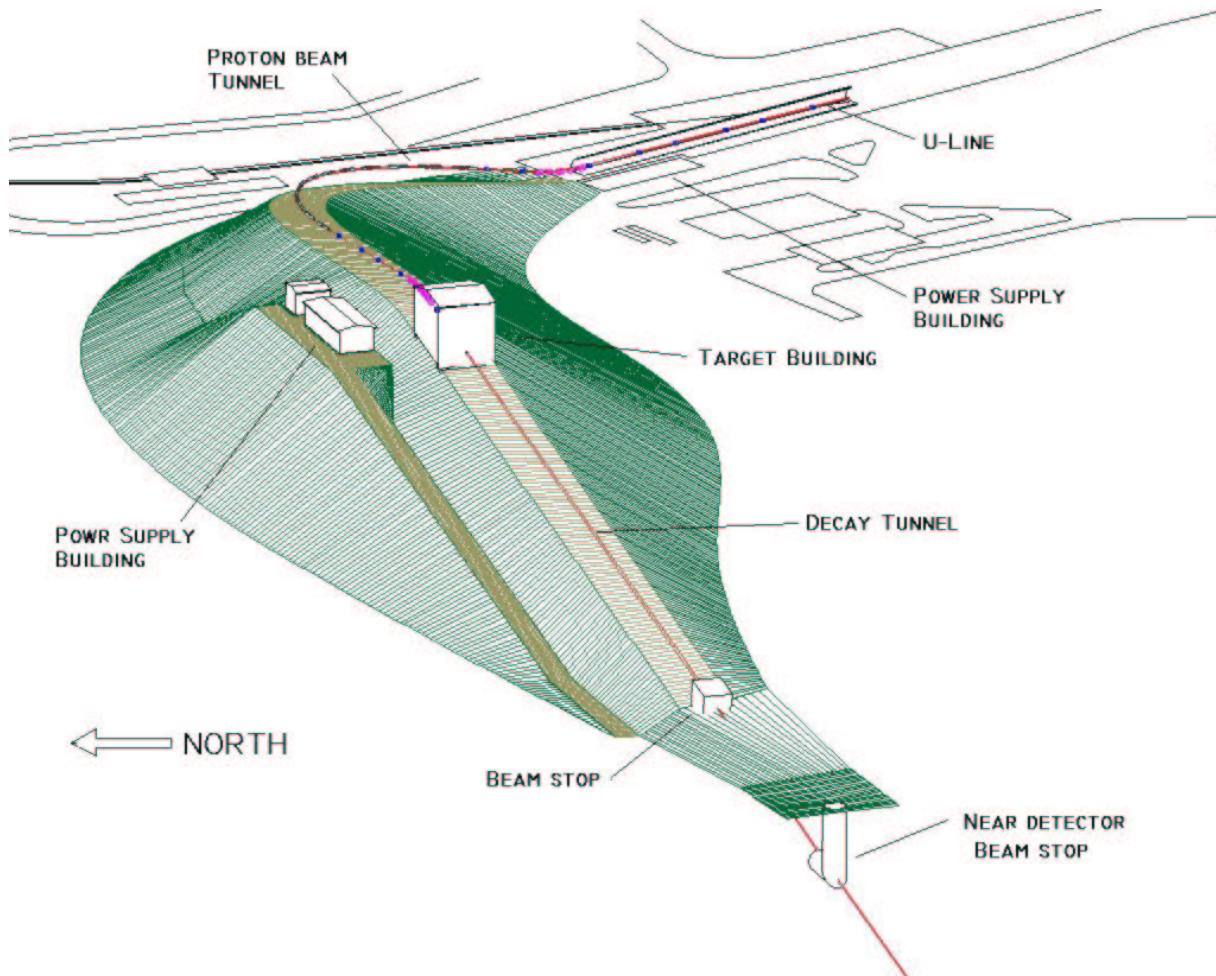

Very long baselines with a superbeam

Beam Layout

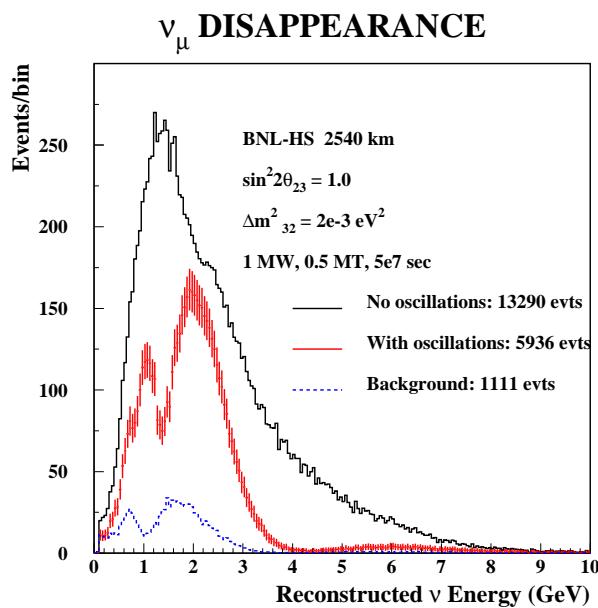

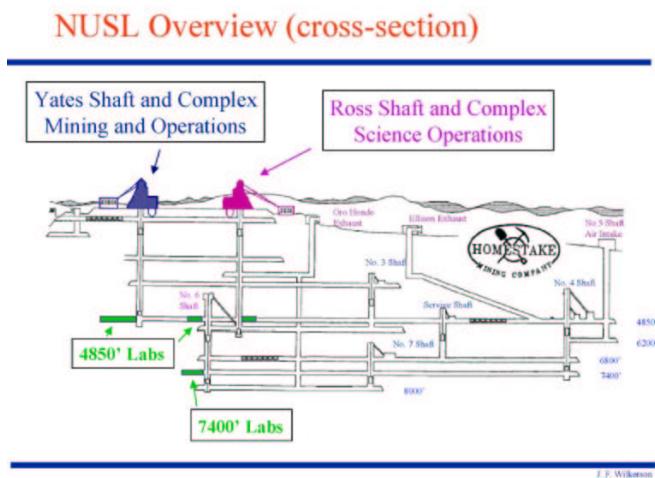

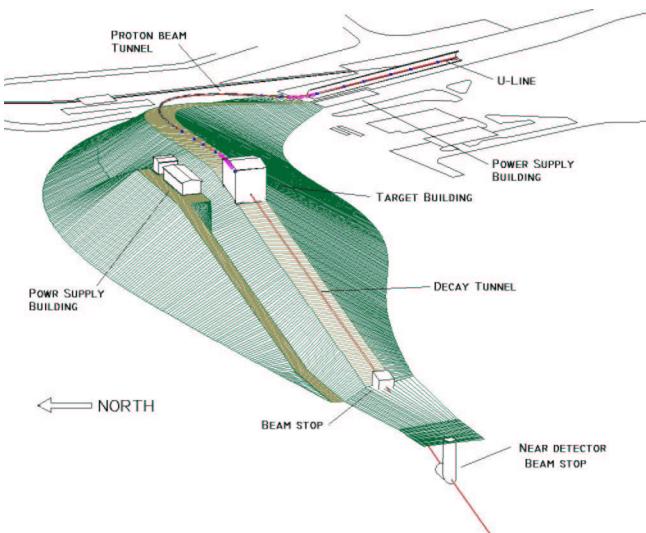

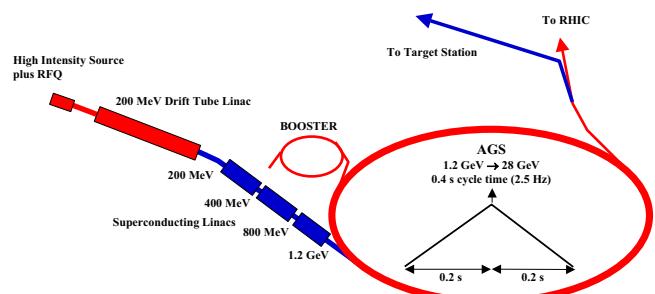

Very long baselines with a superbeam

Beam 3d

1 MW beam - 2540 km - 500 kT detector

Event Rates with Neutrinos

Assume 1 MW, 500 kT Fiducial, 5×10^7 sec running. (1.22×10^{22} Protons at 28 GeV.)

Assume Water Cerenkov detector.

CC $\nu_\mu + N \rightarrow \mu^- + X$	51800 (15160)
NC $\nu_\mu + N \rightarrow \nu_\mu + X$	16908 (5770)
CC $\nu_e + N \rightarrow e^- + X$	380 (103)
QE $\nu_\mu + n \rightarrow \mu^- + p$	11767 (5934)
QE $\nu_e + n \rightarrow e^- + p$	84 (40)
CC $\nu_\mu + N \rightarrow \mu^- + \pi^+ + N$	14574 (4200)
NC $\nu_\mu + N \rightarrow \nu_\mu + N + \pi^0$	3178 (1156)
NC $\nu_\mu + O^{16} \rightarrow \nu_\mu + O^{16} + \pi^0$	574 (202)
CC $\nu_\tau + N \rightarrow \tau^- + X$ (depends on Δm^2)	~ 110 (20)

Backgrounds to clean (QE) events SMALL

NC dominated by elastic and single π .

Low τ production.

Anti-neutrino rate in (brackets) for 1 MW. Neutrino contamination additional.

Neutral Current Events Neutrinos

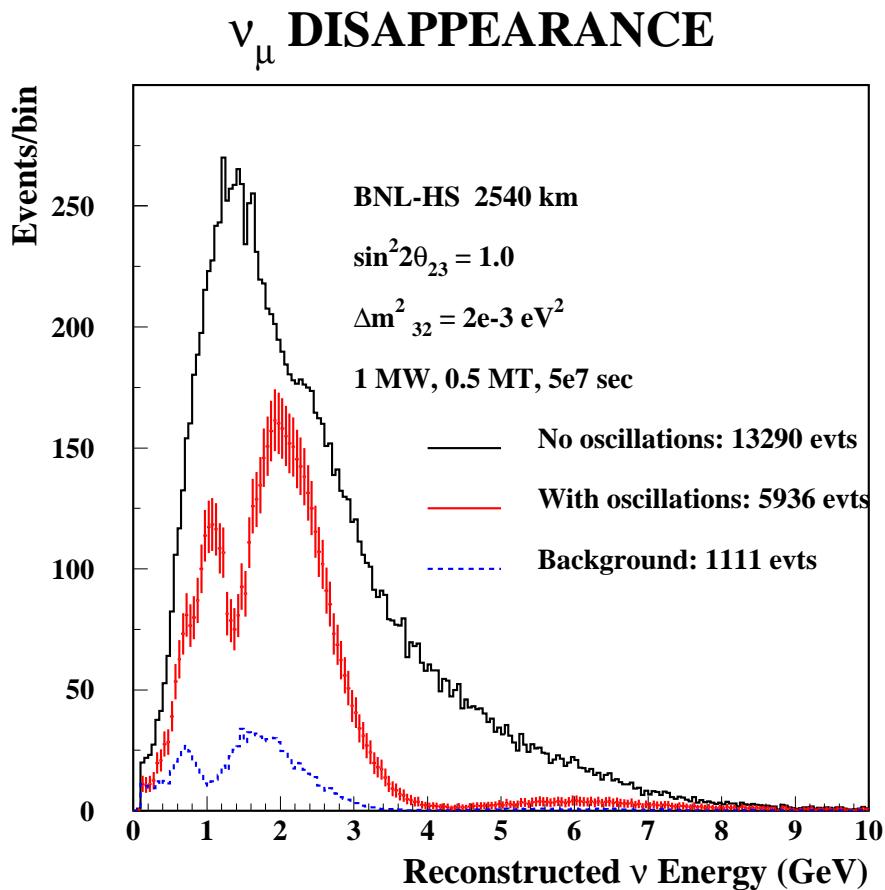

Assume 1 MW, 500 kT Fiducial, 5×10^7 sec running. (1.22×10^{22} Protons at 28 GeV.)

Assume Water Cerenkov detector (with $\sim 10\%$ PMT coverage)

NC $\nu_\mu + N \rightarrow \nu_\mu + X$	16908
Single π^0	3700
Single π^\pm	3500
$\nu + n \rightarrow \nu + n$	2000
$\nu + p \rightarrow \nu + p$	2000
Multi-pi (0 π^0)	2900
Multi-pi ($\geq 1 \pi^0$)	2900

Multiple pion events should be suppressed better than single π^0 events.

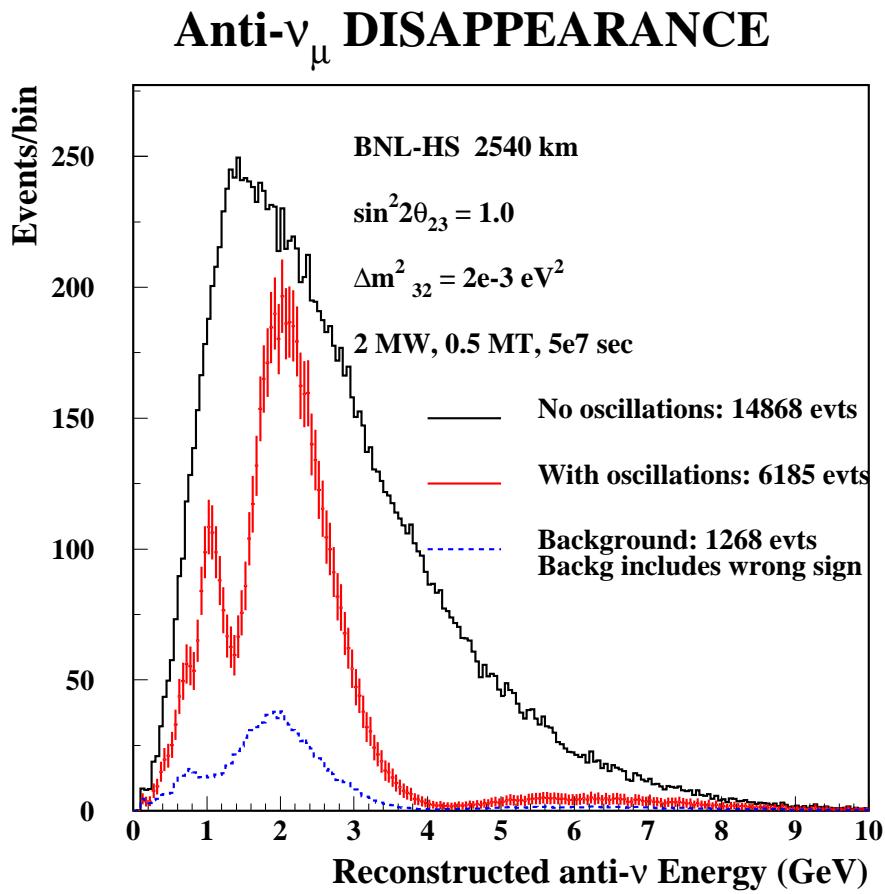

Both single and multi-pi event rate display the same tendency to fall rapidly with energy.

Node pattern provides high Δm^2_{32} resolution.
Energy calibration is very important.

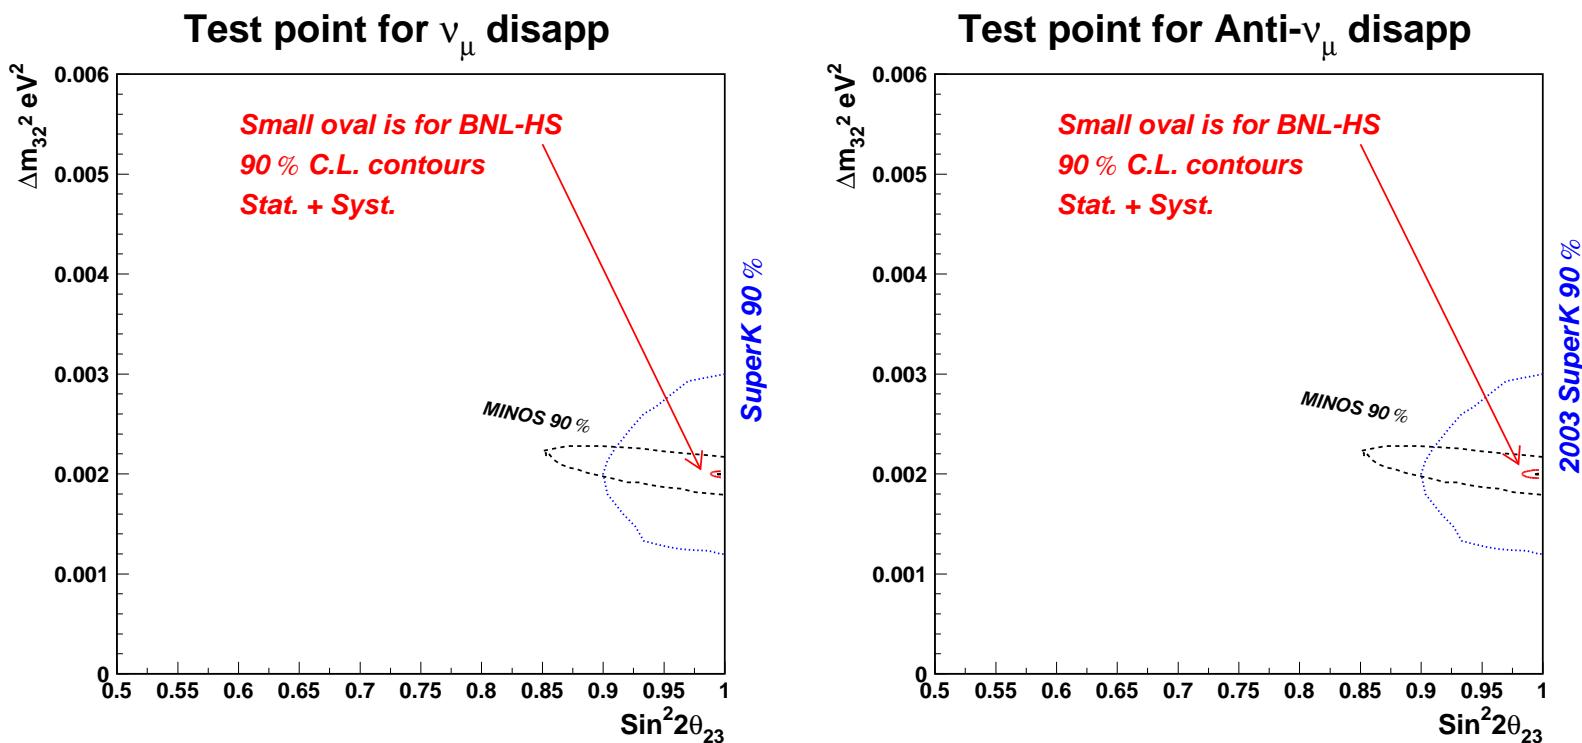

Flux normalization not important for
measurement of $\sin^2 2\theta_{23}$

Background shape can be measured independently
Minimum systematics in ν_μ and $\bar{\nu}_\mu$ comparison

For anti-neutrinos low energy nodes have less statistics because of cross section.

Very long baselines with a superbeam

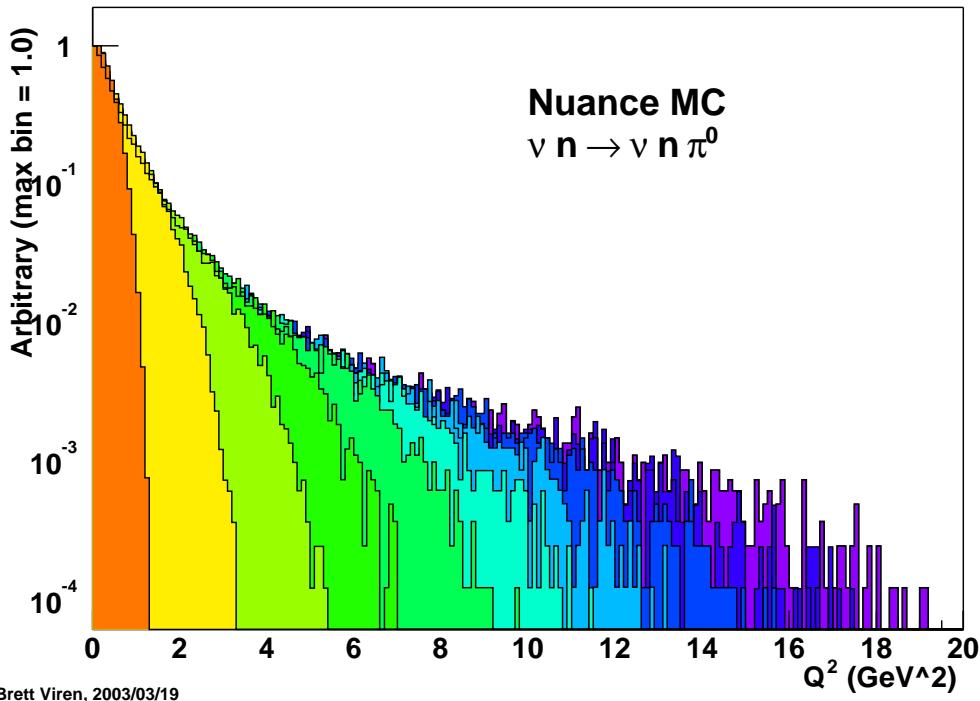

Measurement of Δm_{32}^2

- Little dependence on systematic errors on resolution, backgrounds, energy linearity, or normalization.
- Ultimate resolution on Δm^2 depends on energy calibration. For perfect energy calibration $\pm 0.7\%$ possible.
- Energy calibration at $< 1\%$ in 1-5 GeV region needed.
- Can exclude $\sin^2 2\theta_{23} < 0.99$ at 90% C.L.
Could be better with accurate background subtraction.
- No need of near detector for this measurement. Even a 10% systematic error on normalization does not bother measurement.
- neutrino-antineutrino comparison free of most systematics (even cross section) because of nodal pattern. Possible to measure difference in Δm_{32}^2 of $< 1\%$.

NC π^0 background for $\nu_\mu \rightarrow \nu_e$

Q^2 for $E_\nu = 1\text{-}10 \text{ GeV}$

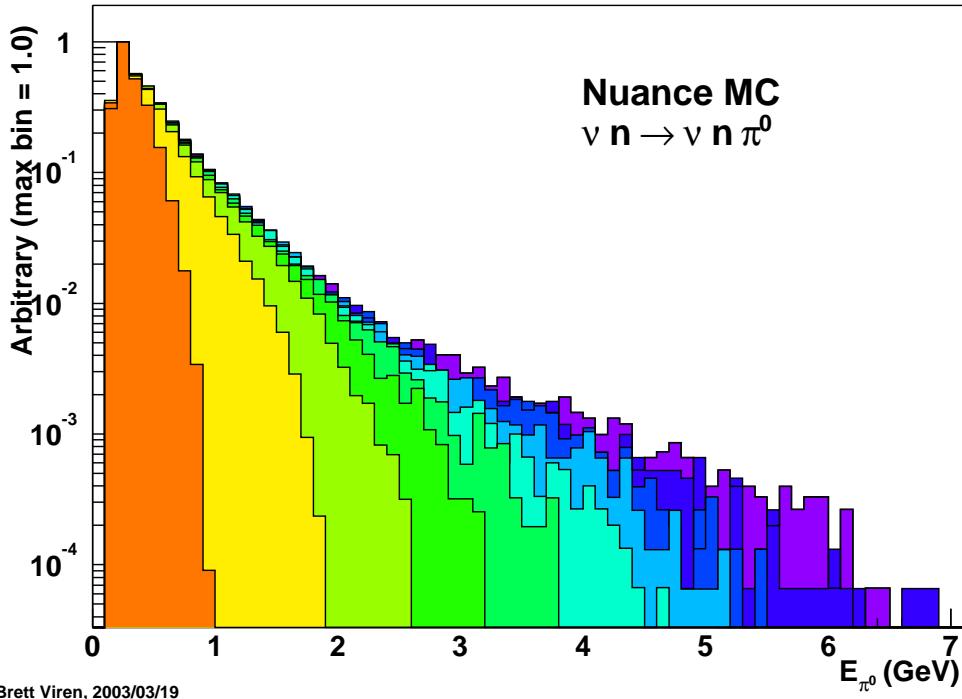

$$q^2 = (p'_N + p'_\pi) - p_N.$$

General feature of all neutral current processes:

Low q^2 or low hadronic energy in final state independent of neutrino energy.

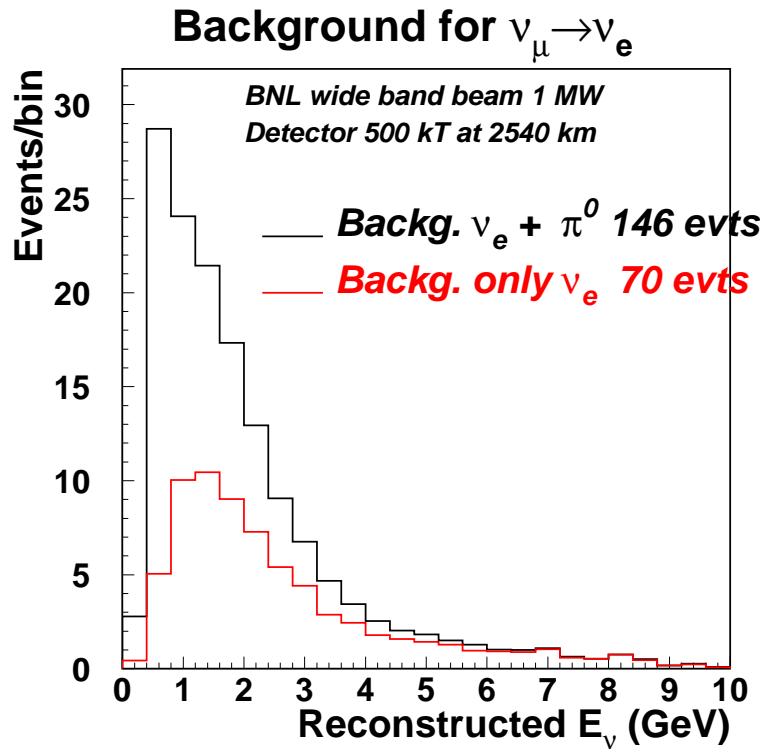

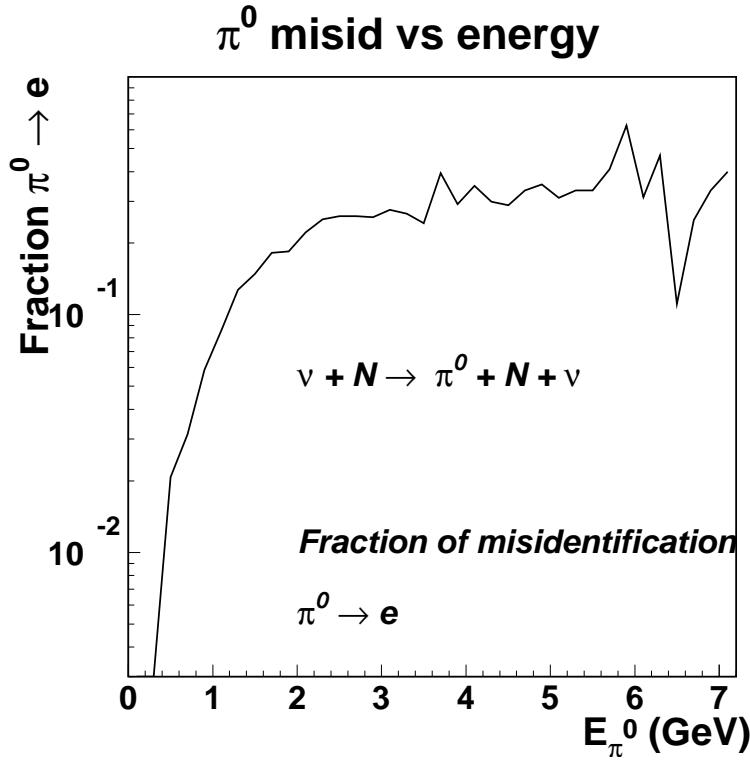

NC π^0 background for $\nu_\mu \rightarrow \nu_e$

E_{π^0} for $E_\nu = 1\text{-}10 \text{ GeV}$

- The NC energy distribution is independent of ν -energy except the kinematic limit.
- In $\nu_\mu N \rightarrow \nu_\mu N \pi^0$ events all energy ν produce peak at the same energy except the tail.
- For a very long baselines and wide band beam ν_e signal will be above 3 GeV with little π^0 background.

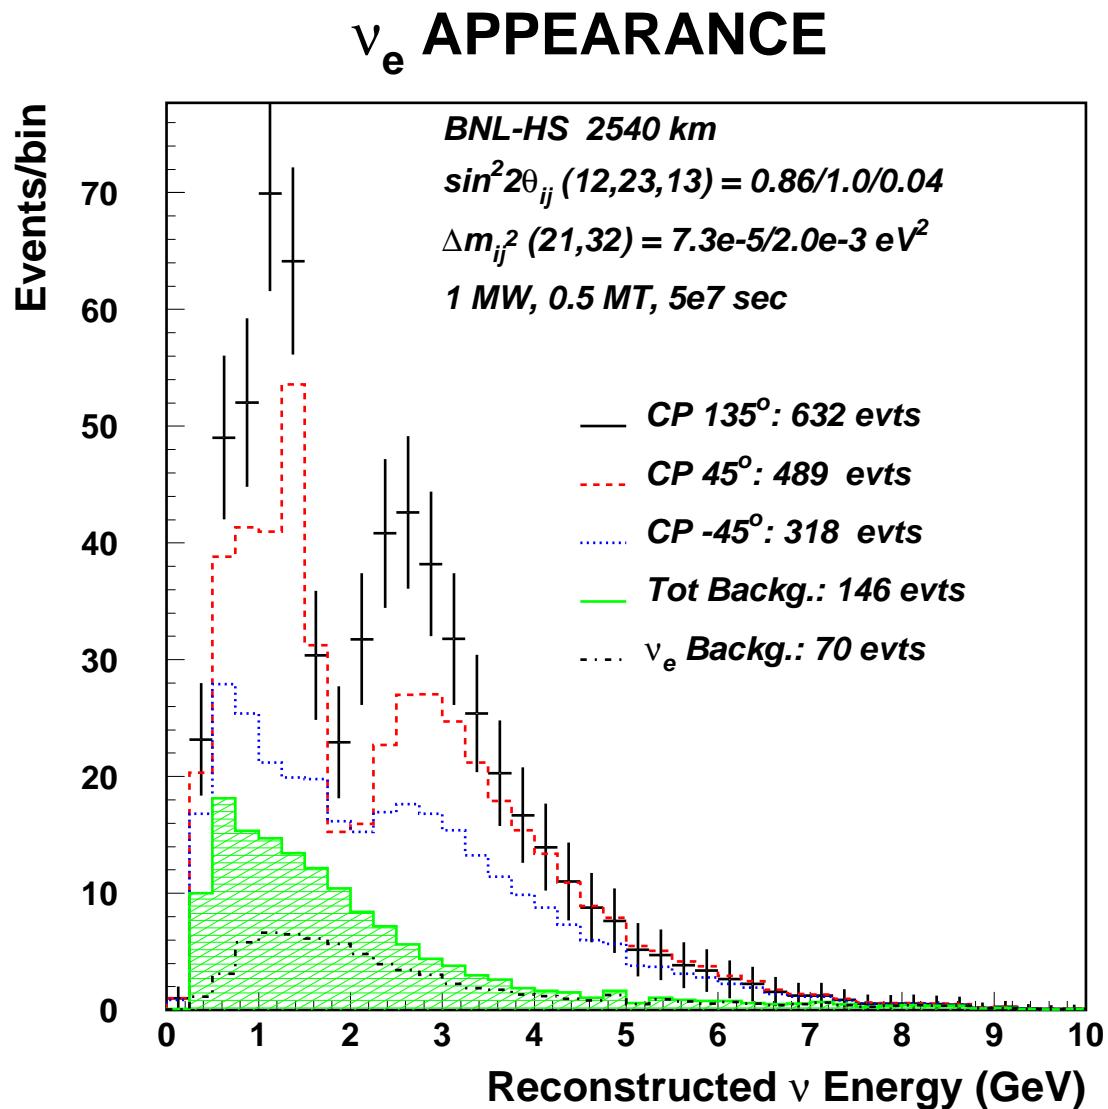

$\nu_\mu \rightarrow \nu_e$ All background

- Background includes $\nu N \pi^0$ and Coherent $\nu O^{16} \pi^0$.
- Efficiency for signal is $\sim 80\%$
- For $E_\nu < 2\text{GeV}$ $N_{\pi^0} : N_{\nu_e} :: 59 : 35$
- For $E_\nu > 2\text{GeV}$ $N_{\pi^0} : N_{\nu_e} :: 17 : 35$

Very long baselines with a superbeam

Measurement of $\sin^2 2\theta_{13}$

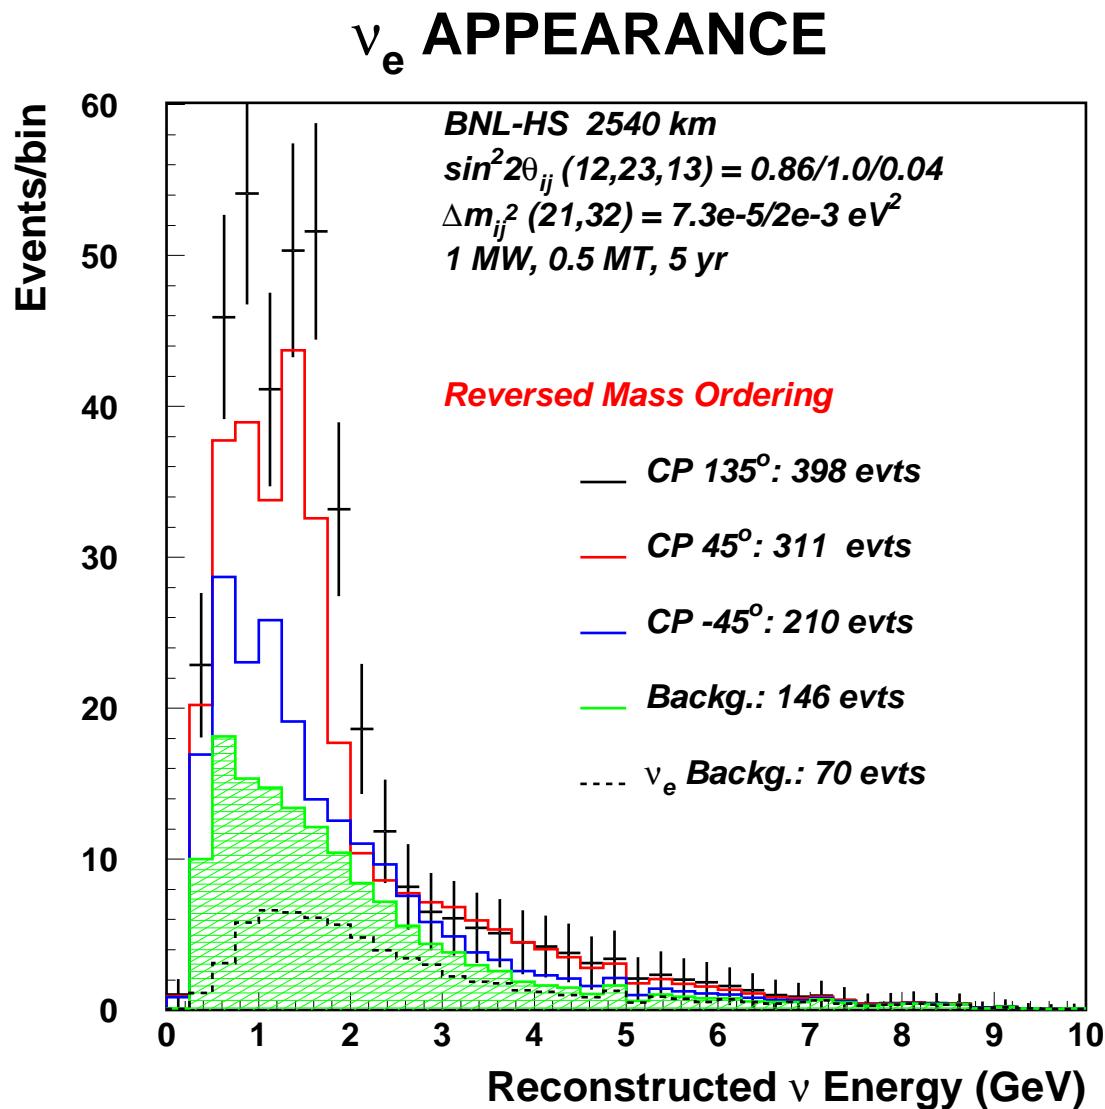

$$\Delta m_{32}^2 = 0.002 \text{ eV}^2, \sin^2 2\theta_{13} = 0.04.$$

Assume normal mass hierarchy. $m_3 > m_2 > m_1$

Matter effects included.

Measurement of $\sin^2 2\theta_{13}$

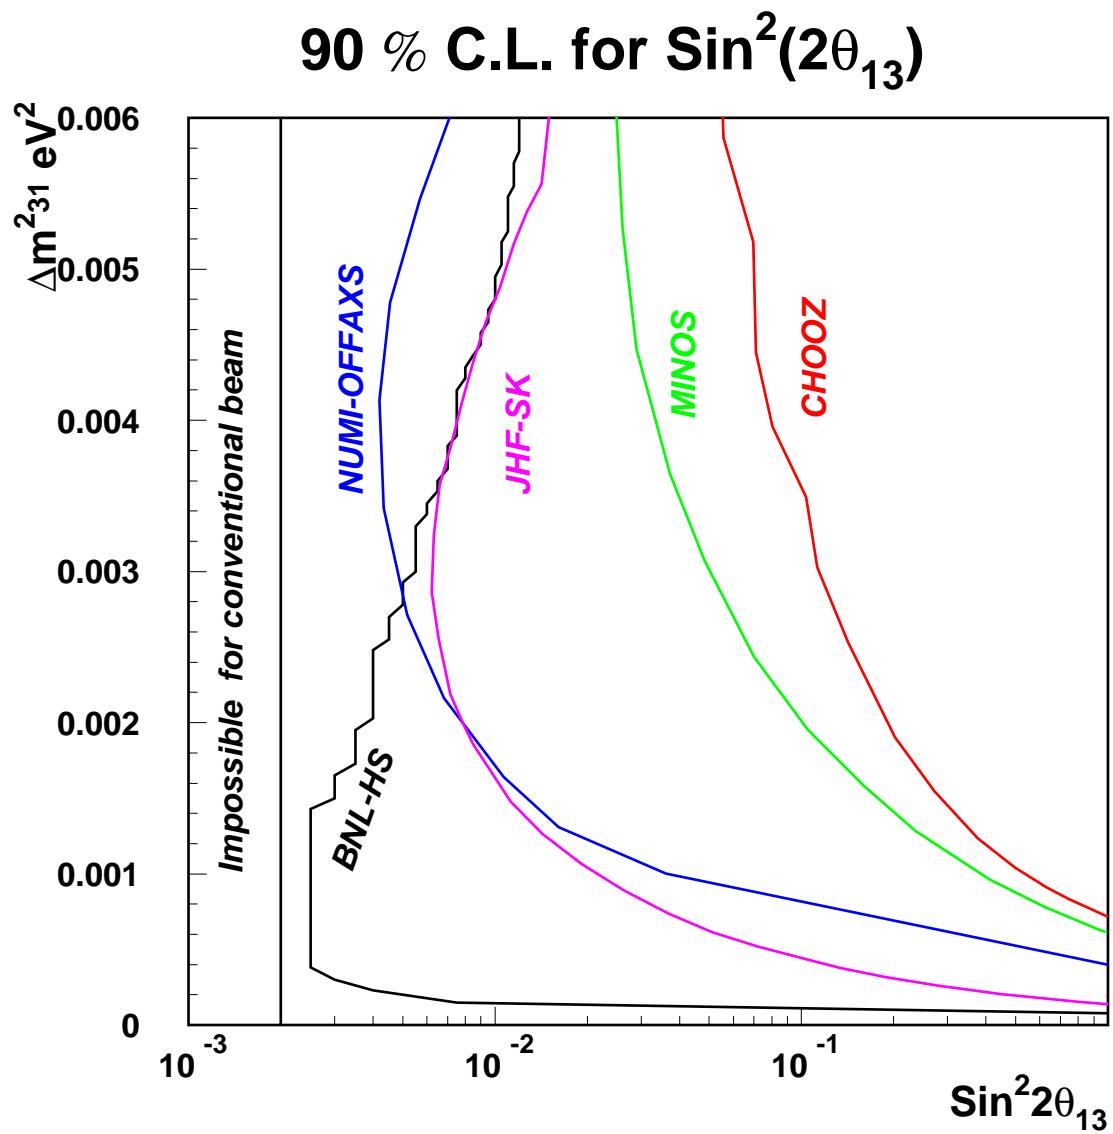

$$\Delta m_{32}^2 = 0.002 \text{ eV}^2, \sin^2 2\theta_{13} = 0.04.$$

Reversed Mass Hierarchy

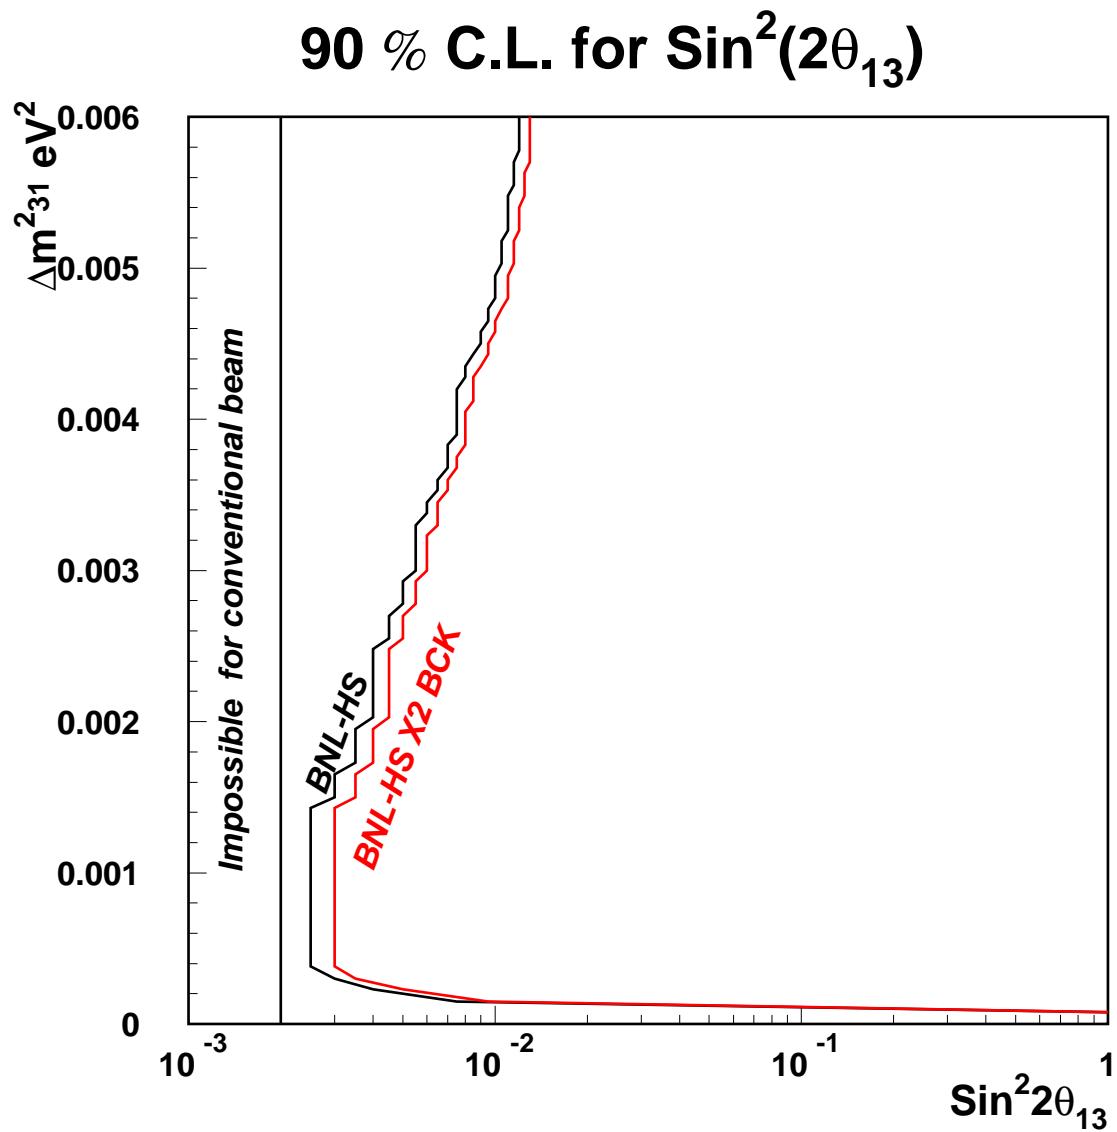

Matter effects included.

Measurement of $\sin^2 2\theta_{13}$ 90% C.L.

Distinctive signature with multiple oscillations
above 0.001 eV^2

Measurement of $\sin^2 2\theta_{13}$ 90% C.L. high Bckg.

Assume that the neutral current background is higher by factor of 2 over the entire spectrum.

Measurement of $\sin^2 2\theta_{13}$ 90% C.L.

BNL-HS(2540 km) good sensitivity to $\sin^2 2\theta_{13}$.

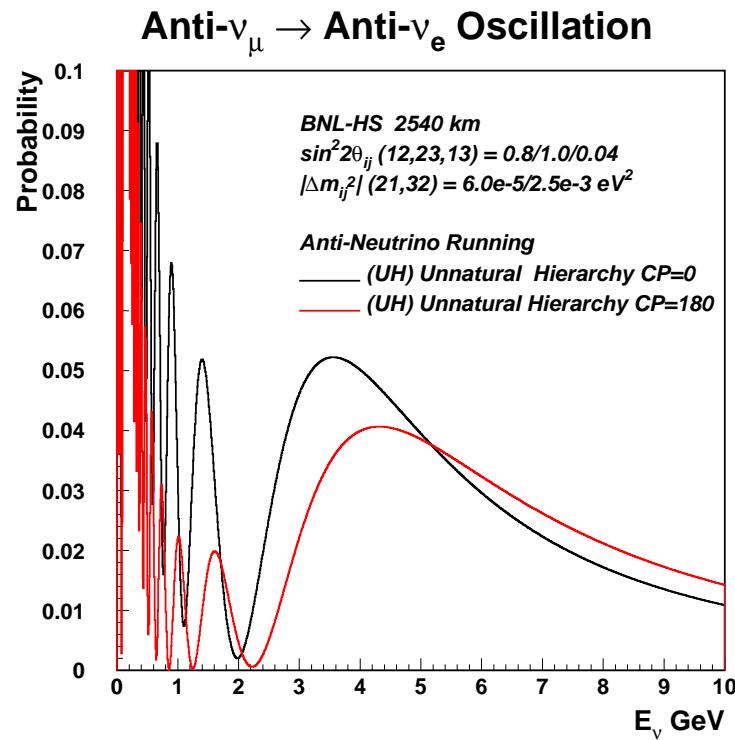

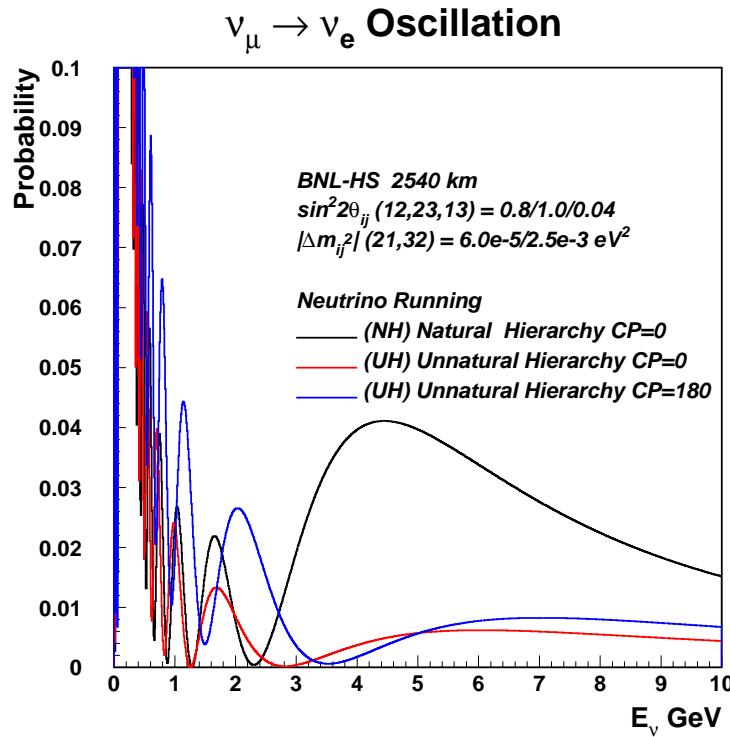

Improvement from 0.12 to 0.005 at 0.0025 eV^2 .

Signal very distinctive above 0.001 eV^2 .

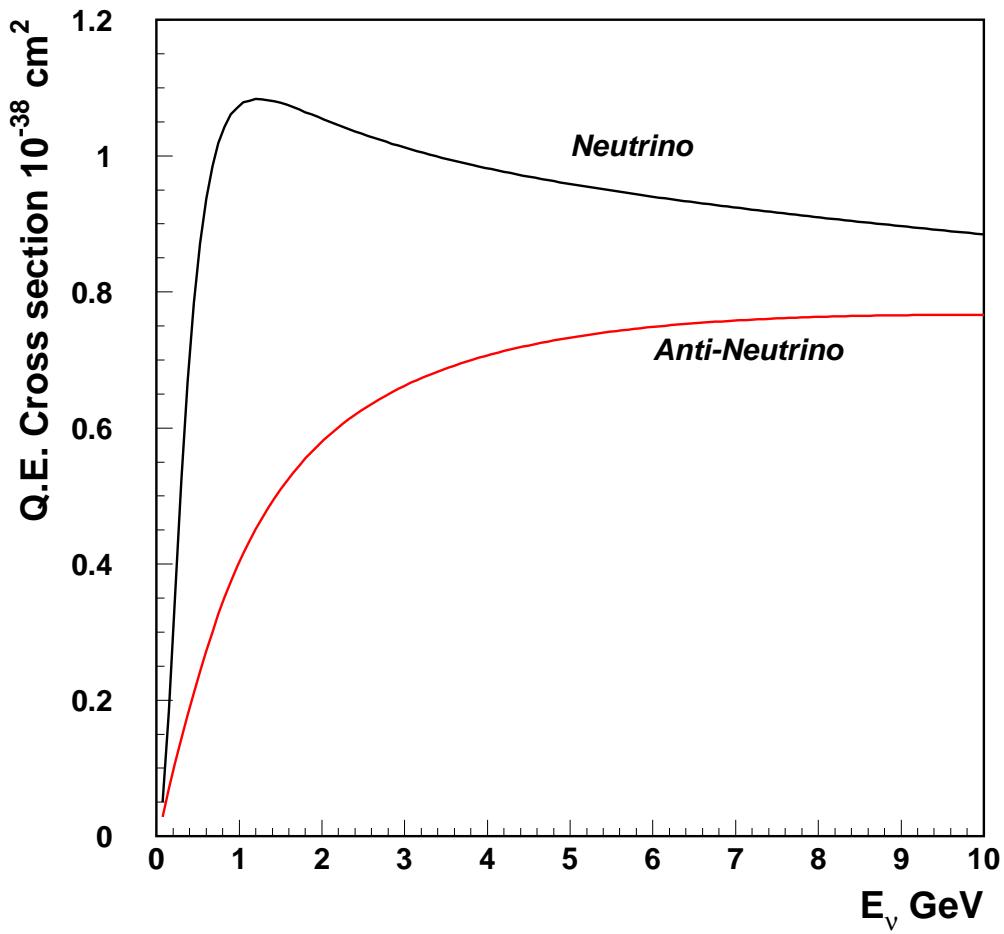

Need harder beam to improve sensitivity above 0.004 eV^2 .

No experiment can go below $\sin^2 2\theta_{13} \approx 0.002$ with horn focussed beam due to systematic error on intrinsic ν_e background.

Mass Hierarchy Anti-neutrinos

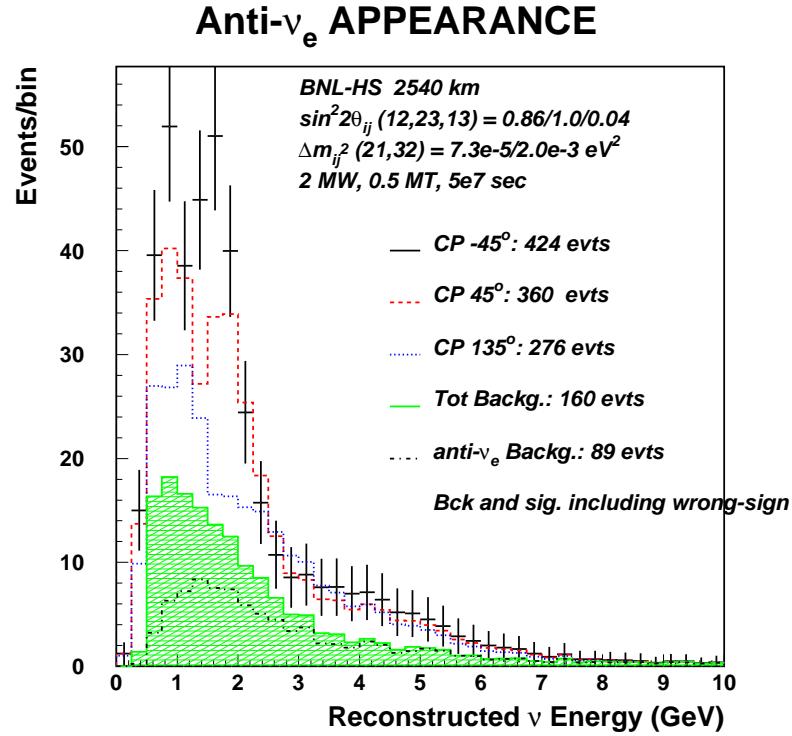

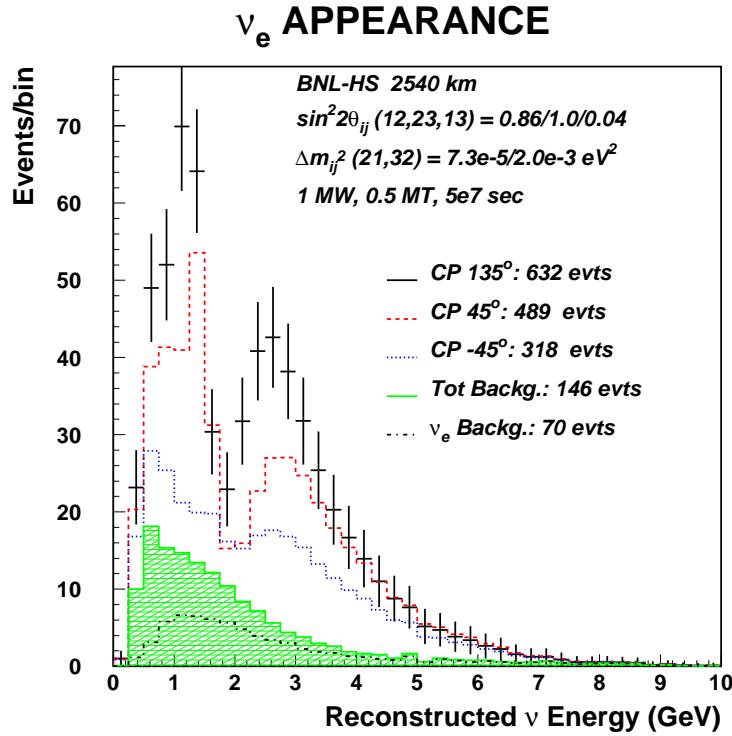

Quasielastic cross section

An experiment searching for signal at high energies may not need much more anti-neutrino running than neutrino running.

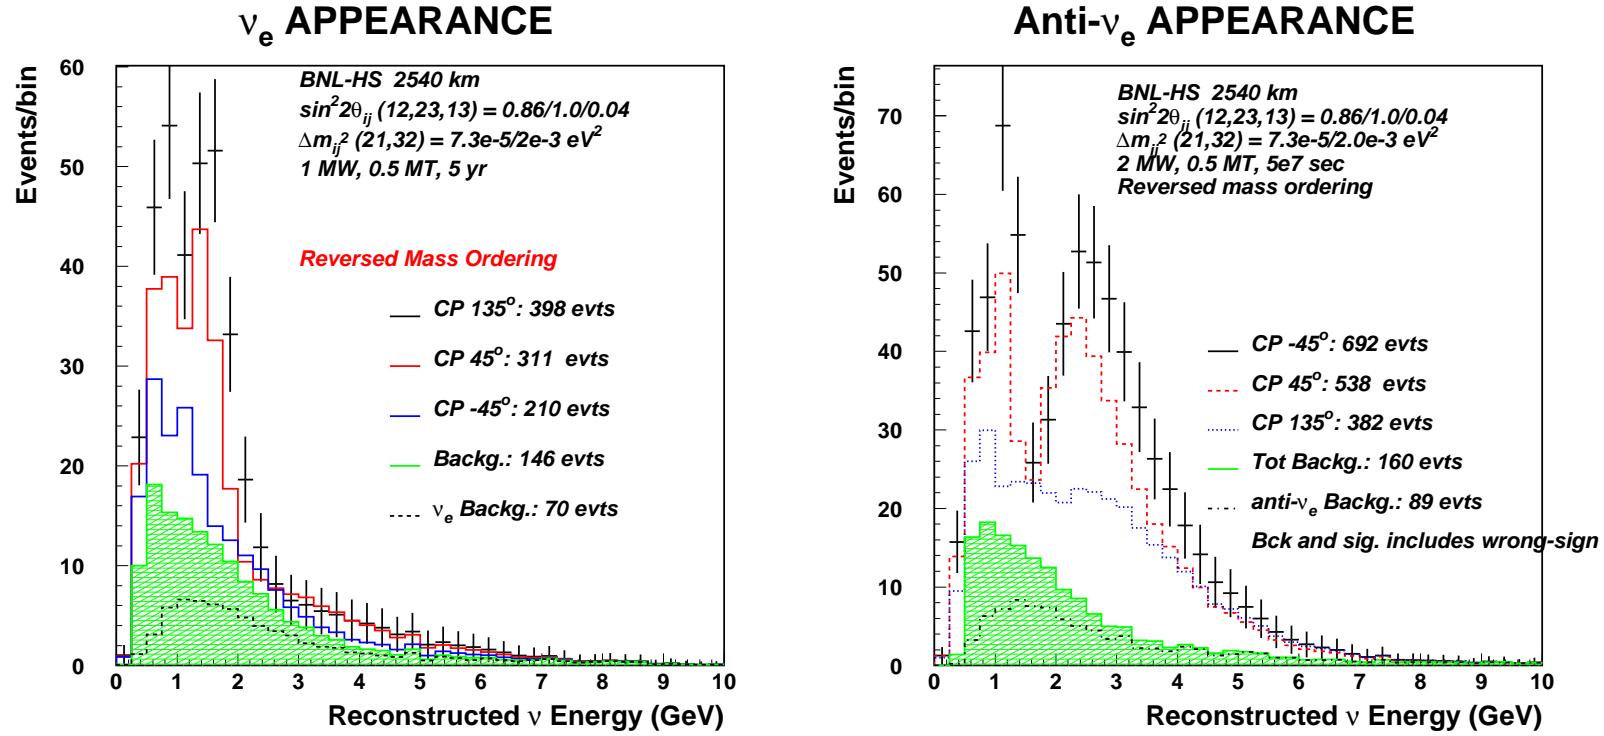

Running for $\sin^2 2\theta_{13}$

$\Delta m_{32}^2 = 0.002 \text{ eV}^2$, $\sin^2 2\theta_{13} = 0.04$. Assume normal mass hierarchy. $m_3 > m_2 > m_1$ Matter effects included.

Very long baselines with a superbeam

Running for $\sin^2 2\theta_{13}$

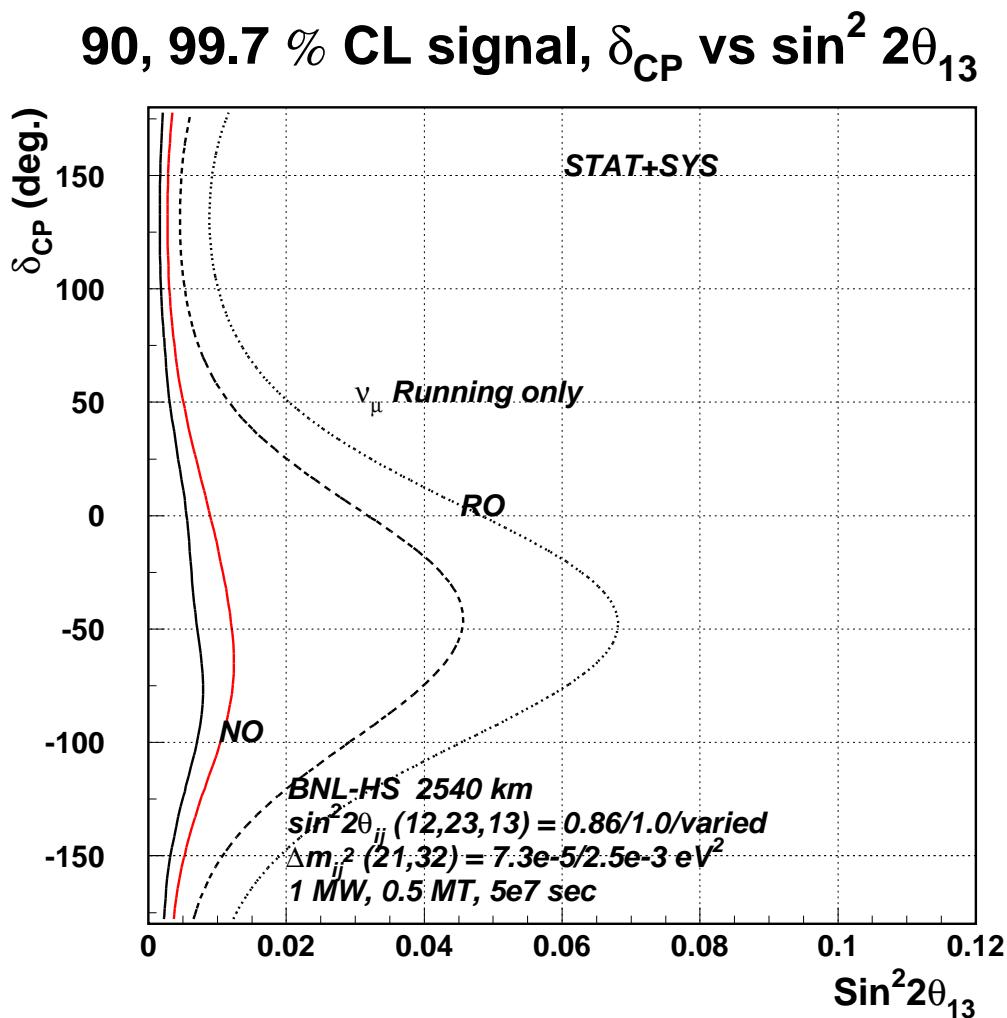

$$\Delta m_{32}^2 = 0.002 \text{ eV}^2, \sin^2 2\theta_{13} = 0.04.$$

Reversed Mass Hierarchy

Matter effects included.

Very long baselines with a superbeam

Mass Hierarchy

Natural Mass hierarchy: $m_3 > m_2 > m_1$ (NO)

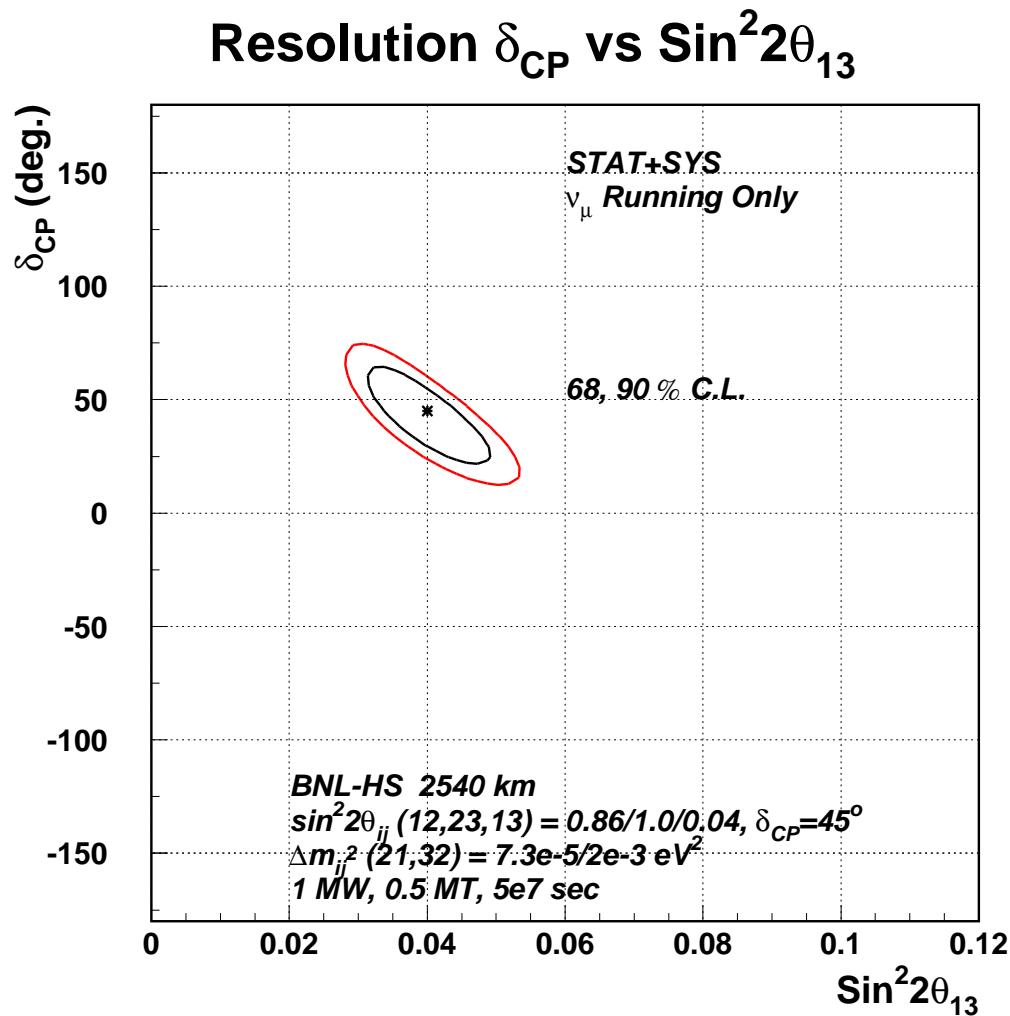

Reversed Mass hierarchy: $m_1 > m_2 > m_3$ (RO)

Unnatural Mass hierarchy: $m_2 > m_1 > m_3$ (RO)

$m_1 > m_2$ is ruled out if Solar LMA is the correct solution.

We would need to run Anti-neutrino beam to fully explore RO.

Measurement of $\delta_{CP} = 45^\circ$
No anti-neutrino running.

Systematic error of 10% on backg.

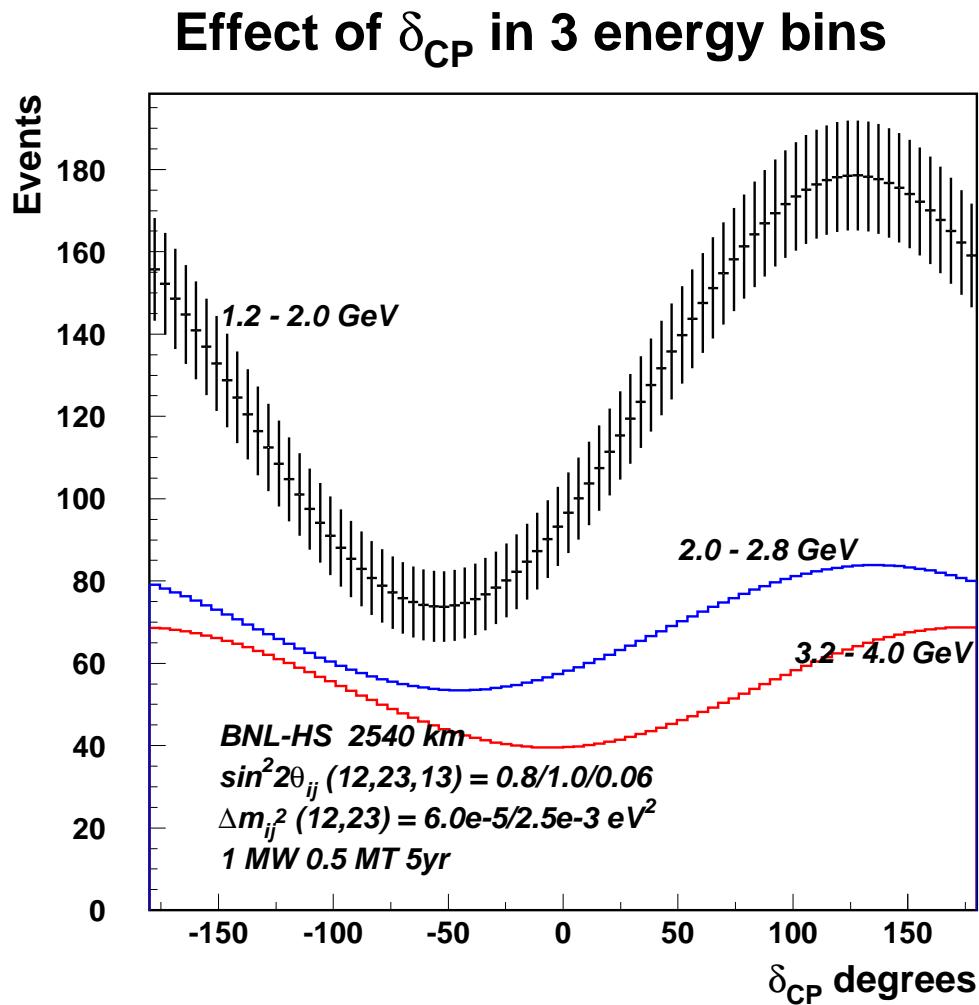

$$\Delta m_{21}^2 = 7.3 \times 10^{-5} \text{ eV}^2, \Delta m_{31}^2 = 2 \times 10^{-3} \text{ eV}^2$$

$$\sin^2 2\theta_{12} = 0.86, \sin^2 2\theta_{23} = 1.0$$

$$\delta_{CP} = 45^\circ, \sin^2 2\theta_{13} = 0.04$$

68%, and 90% C.L.

Effect of δ_{CP} on the spectrum.

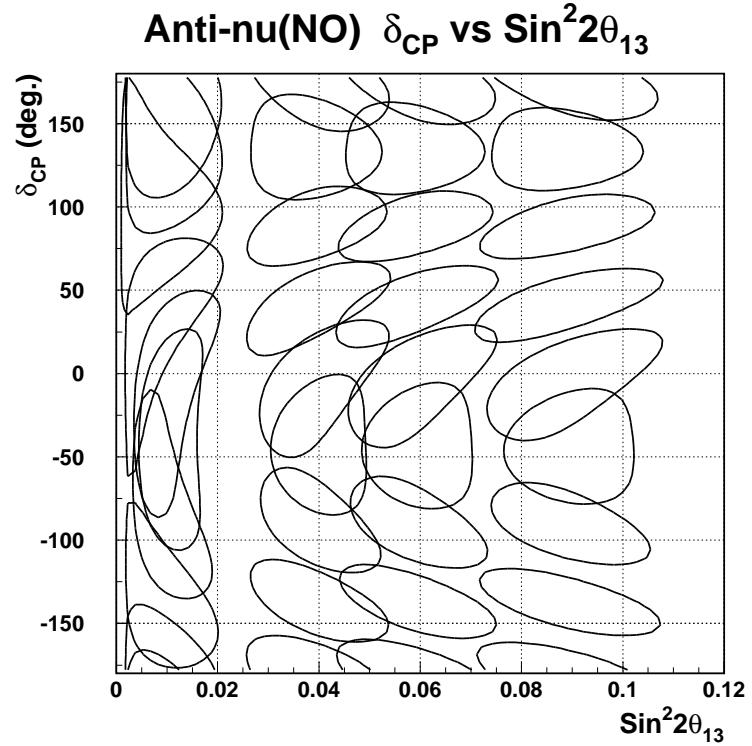

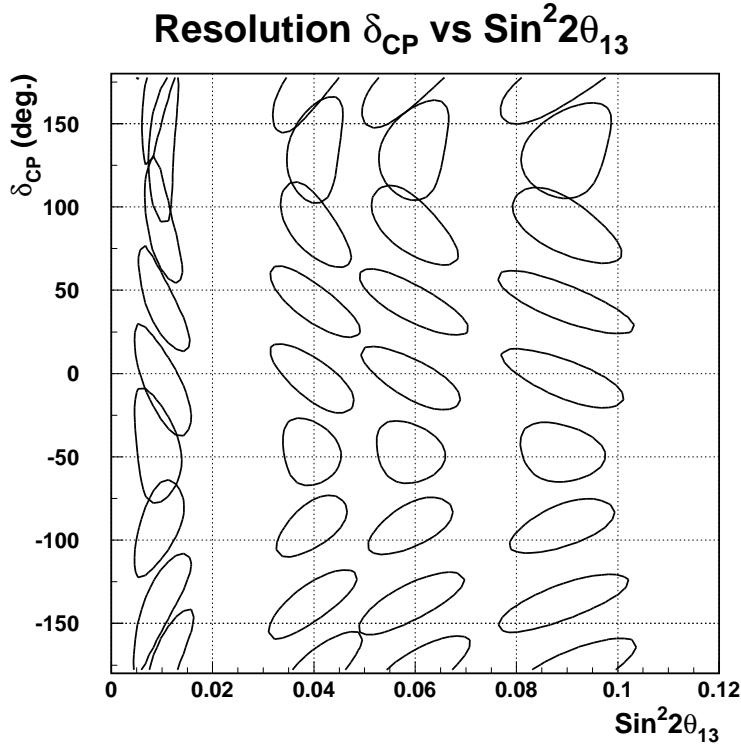

Event rate in 3 energy bins.

$$\Delta m_{21}^2 = 6 \times 10^{-5} \text{ eV}^2, \Delta m_{31}^2 = 2.5 \times 10^{-3} \text{ eV}^2$$

$$\sin^2 2\theta_{12} = 0.8, \sin^2 2\theta_{23} = 1.0$$

$$\sin^2 2\theta_{13} = 0.06$$

Error on δ_{CP} vs $\sin^2 2\theta_{13}$

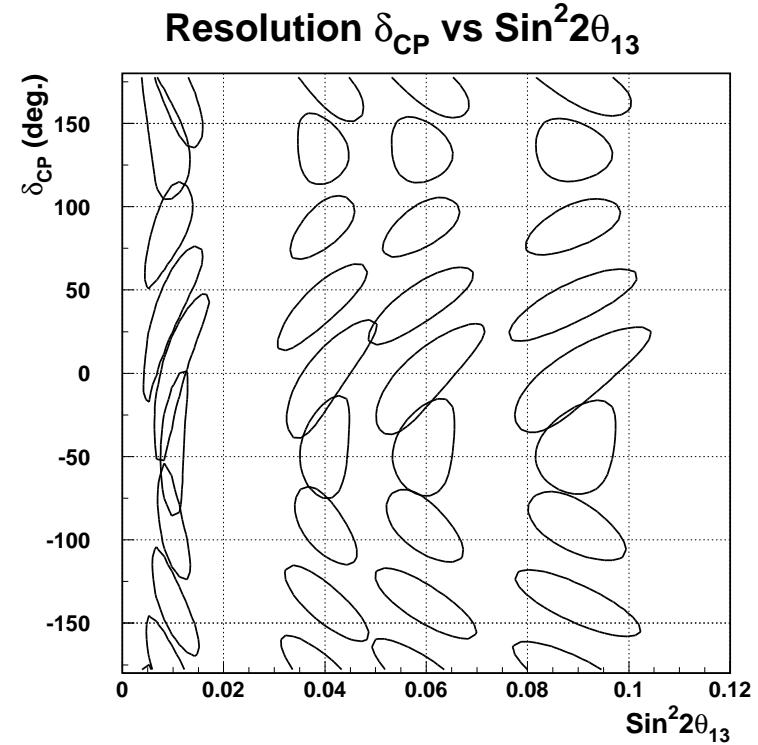

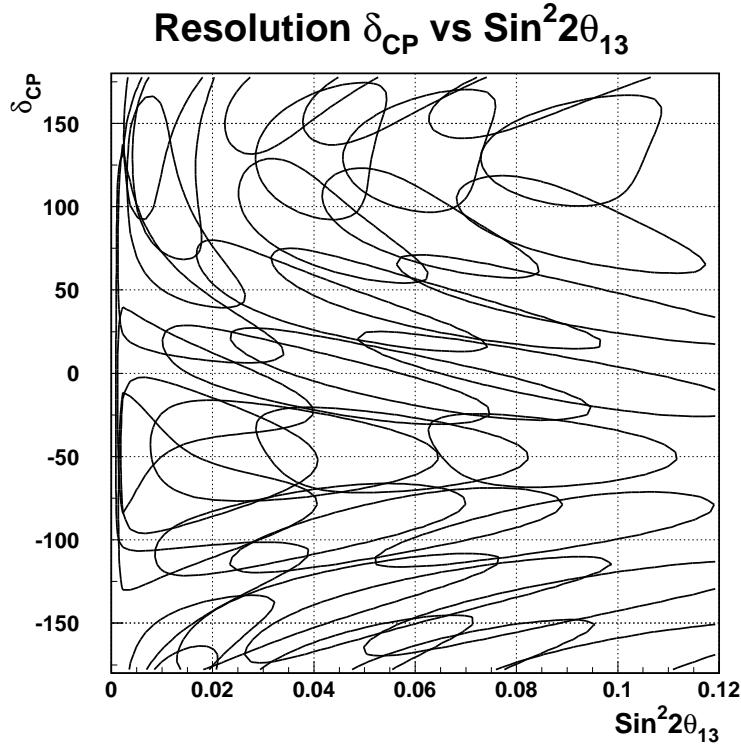

Very long baselines with a superbeam

$$\Delta m_{21}^2 = 7.3 \times 10^{-5} eV^2, \Delta m_{31}^2 = 2 \times 10^{-3} eV^2$$

$$\sin^2 2\theta_{12} = 0.86, \sin^2 2\theta_{23} = 1.0$$

Error on δ_{CP} vs $\sin^2 2\theta_{13}$

Very long baselines with a superbeam

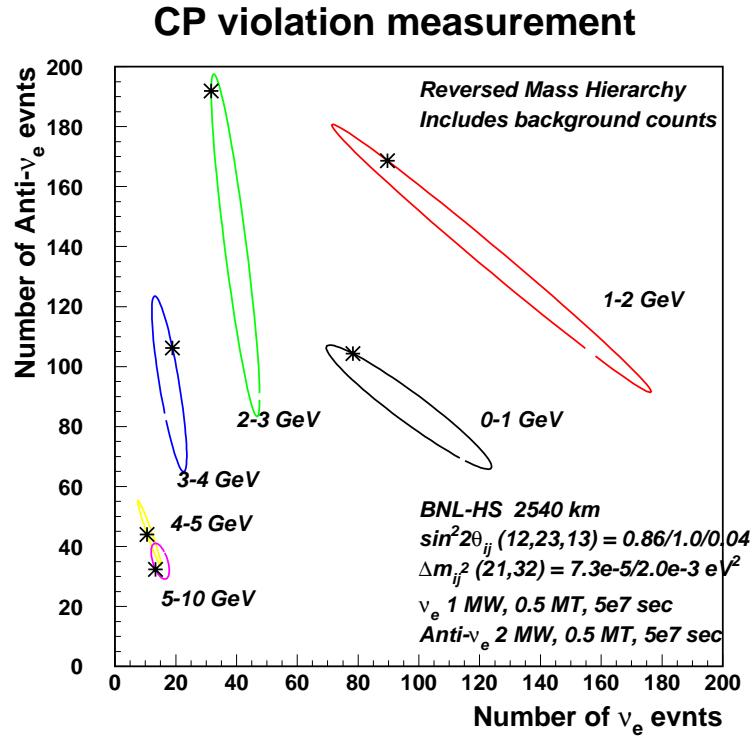

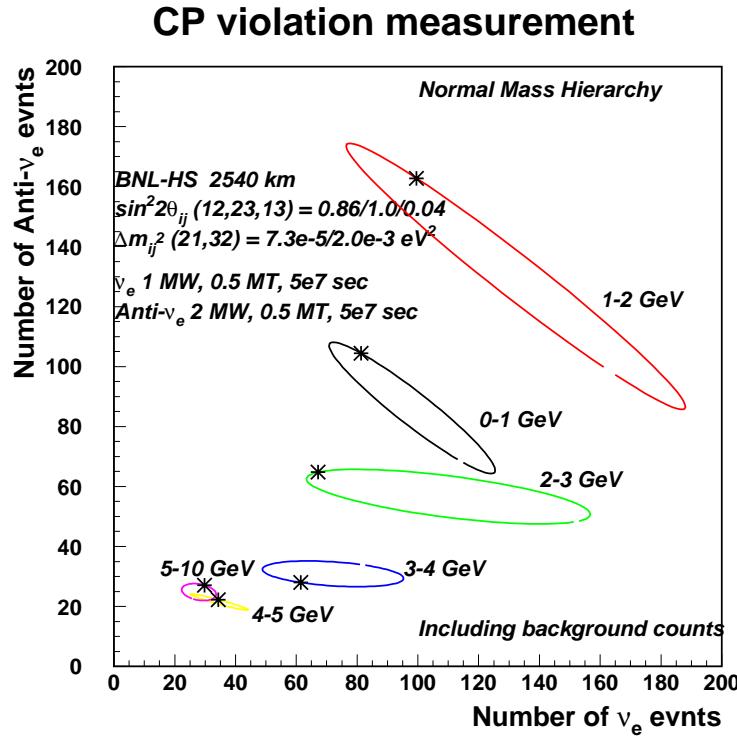

Reversed hierarchy.

$$\Delta m_{21}^2 = 7.3 \times 10^{-5} eV^2, \Delta m_{31}^2 = 2 \times 10^{-3} eV^2$$

$$\sin^2 2\theta_{12} = 0.86, \sin^2 2\theta_{23} = 1.0$$

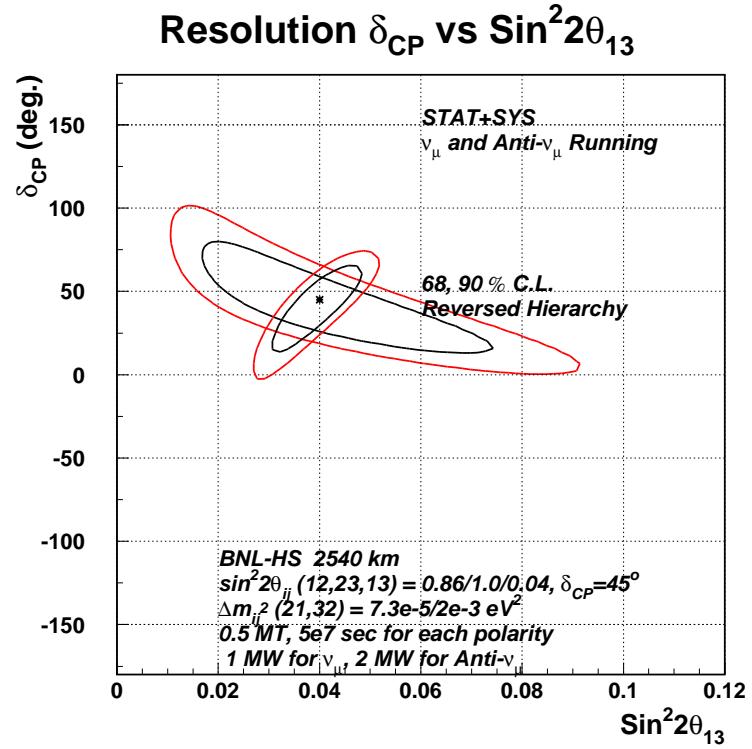

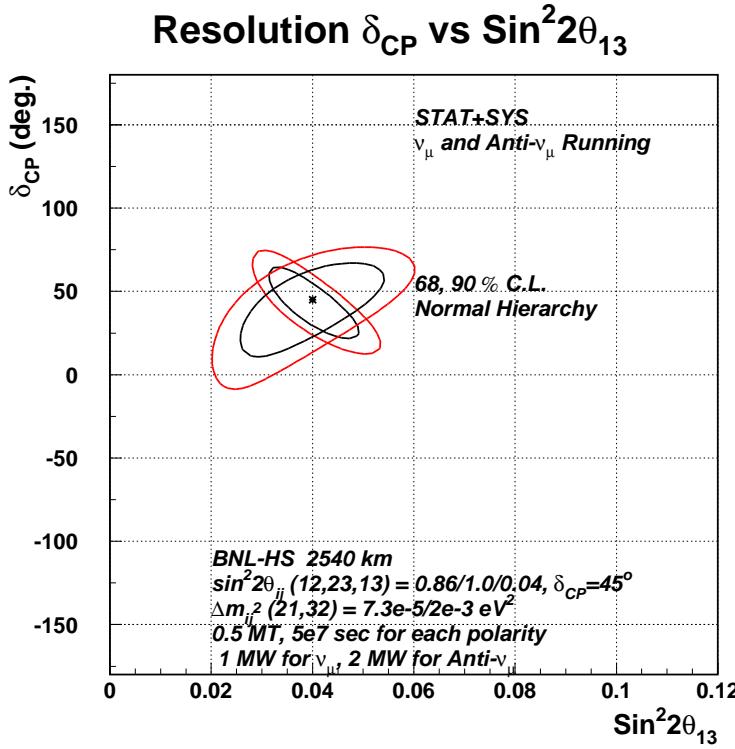

Combining Neutrino and Antineutrino

Very long baselines with a superbeam

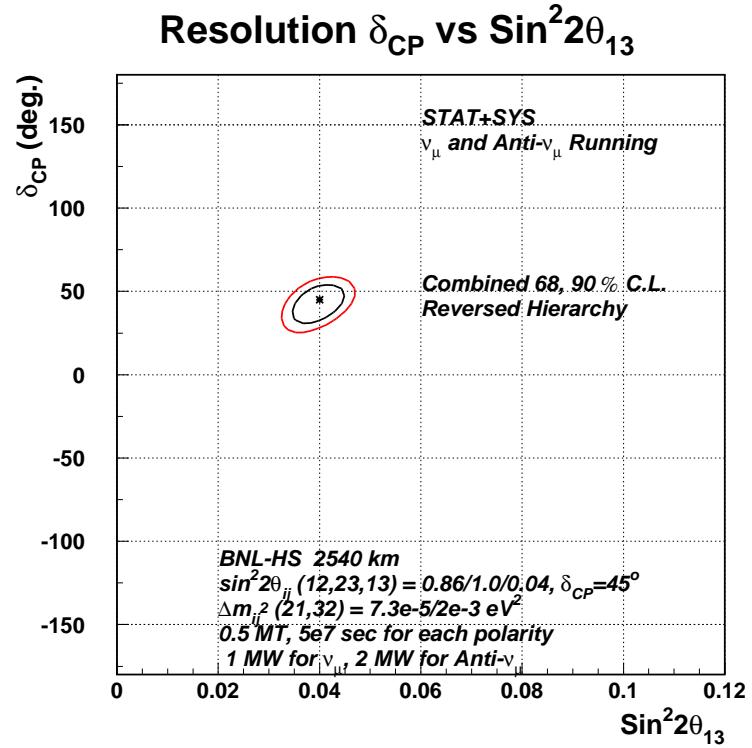

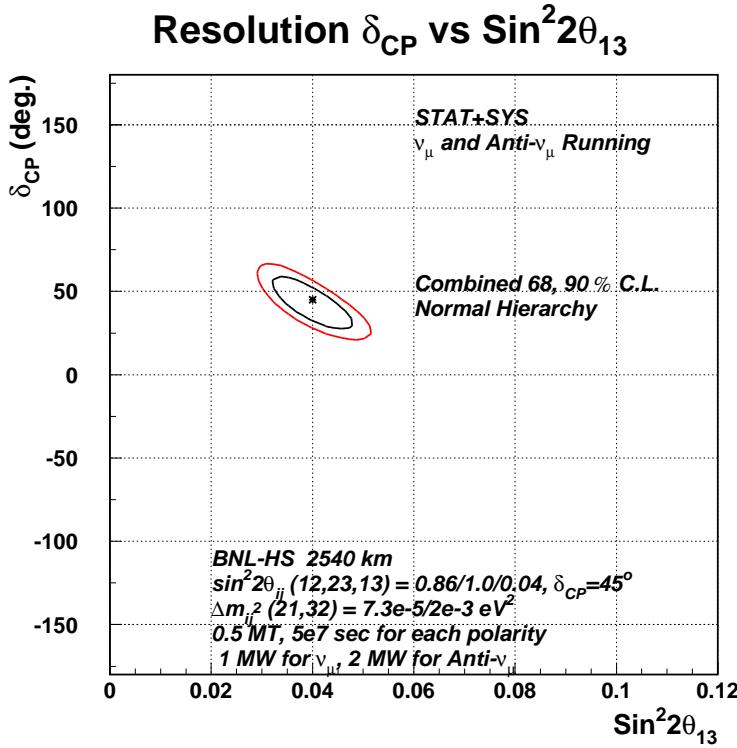

Note: No experiment can avoid matter effect. Explicit demonstration of CP violation must rely on a detailed fit to both neutrino and anti-neutrino data.

Very long baselines with a superbeam

Measurement of Δm_{12}^2

$$\theta_{13} = 0, \Delta m_{12}^2 = 7.3 \times 10^{-5} \text{ eV}^2$$

Excess of ~ 90 events. Must know background

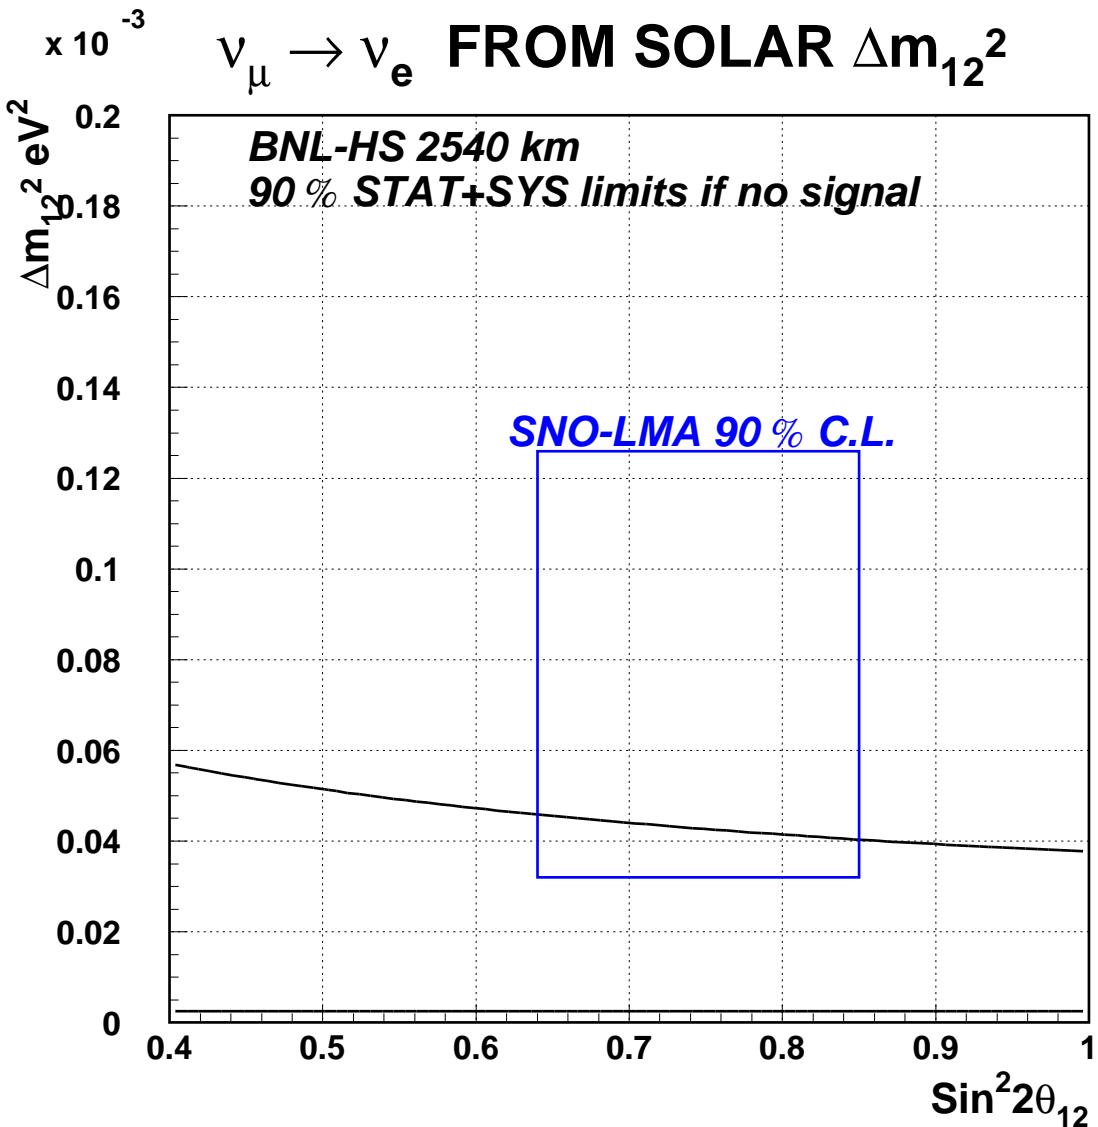

Measurement of Δm_{21}^2

Independent $\sim 15\%$ measurement of Δm_{21}^2

Needs $\sim 10\%$ error on backg. \Rightarrow near detector.

Limit on Δm_{21}^2 vs $\sin^2 2\theta_{12}$

If no signal then a limit can be obtained that almost eliminates LMA.

Analysis Flow Chart

How the experiment will proceed:

- After 2 years of running get a very precise measurement of Δm_{32}^2 from disappearance and definitive signal of oscillations.
- From the measured Δm_{32}^2 predict the shape of the electron spectrum including matter effects.
- Do we have a peak in the electron spectrum at the expected energy ? Yes No
- NO: Either $\sin^2 2\theta_{13}$ too small or inverted mass hierarchy $\Delta m_{32}^2 < 0$.
 - Get an independent measurement of Δm_{21}^2 at about $\pm 15\%$.
 - Run with anti-neutrinos. (next next slide)
- YES: GREAT NEWS ! GOTO NEXT SLIDE.

- YES: There is a peak in the electron spectrum from the neutrino beam.
 - Use Δm_{21}^2 from SNO and KamLAND and make a fit to the spectrum for CP angle versus $\sin^2 2\theta_{13}$.
 - Accumulate more statistics and make a combined fit for Δm_{21}^2 , δ_{CP} and θ_{13} .
 - Is the CP angle too small ? NO YES
- NO: Finished ! Still run antineutrinos for more precise δ_{CP} .
- YES: Run anti-neutrinos for more sensitivity on δ_{CP} .
Measure both $\sin^2 2\theta_{13}$ and δ_{CP}

- Running with anti-neutrinos if no peak in the electron spectrum from neutrinos

Is there a peak in the electron spectrum from anti-neutrinos ? **Yes No**

- **Yes** The mass hierarchy is inverted.
Proceed to measure $\sin^2 2\theta_{13}$ and CP angle with anti-neutrinos.
- **No** $\sin^2 2\theta_{13}$ is too small. Proceed to social work.

If inverted hierarchy;

measure both $\sin^2 2\theta_{13}$ and

δ_{CP} .

OR $\sin^2 2\theta_{13}$ is just too small for conventional beam.

Summary of our study

- Baseline of > 2000 km with wide band conventional beams are the next step in accelerator neutrino physics.
- Extraordinary, large physical effects will be seen in such an experiment.
- Very good sensitivity to neutrino properties.
 - $< 1\%$ resolution on Δm_{32}^2
 - $< 1\%$ resolution on $\sin^2 2\theta_{23}$
 - Sensitivity to $\sin^2 2\theta_{13} \sim 0.005$ over a wide range of Δm_{32}^2
 - Sensitivity to CP parameter $\pm 25^\circ$ with neutrinos alone.
 - Sign of Δm_{32}^2 over a wide range.
 - Measurement of Δm_{21}^2 at $\pm 15\%$
- The electron spectrum has a lot of physics. It can be extracted using some outside information on parameter.

Measurement matrix

Neutrino running only; Running: 5×10^7 sec.

Baseline: 2540 km; beam: 1 MW at 28 GeV; detector: 500 kT

	Δm_{32}^2	$\sin^2 2\theta_{23}$	Δm_{21}^2	$\sin^2 2\theta_{13}$ 90 % C.L.	δ_{CP}
$\Delta m_{32}^2 > 0.001$ $\sin^2 2\theta_{13} > 0.01$	< 1%	$\sim 1\%$	$\pm 15\%$	± 0.01	$\pm 25^\circ$
$\Delta m_{32}^2 > 0.001$ $\sin^2 2\theta_{13} < 0.01$	< 1%	$\sim 1\%$	$\pm 15\%$	Limit < 0.005	No Measure.

Not complete story, but an impression. Assume $m_3 > m_2 > m_1$.

Need good energy calibration for Δm_{32}^2 ($\sim 100 MeV$ LINAC ?)

Need small error on backg. for Δm_{21}^2 and CP. (Near Detector)

Some comments on detector

- Detector studies have started. Need more manpower.
- Water Cherenkov
 - 50 kT SuperK is existence proof.
 - Background rejection ? need another $\times 3$ to 5 to reach level in this talk.
 - Additional imaging capability ?
- Liquid Argon TPC
 - 100 kT module never built.
 - Current size 300Ton.
 - Needs detailed simulations.
- Any other technology ?

What is Next ?

White paper: hep-ex/0211001

Short paper: hep-ph/0303081, published PRD68,
012002, 2003

Can we use events such as $\nu_e + N \rightarrow e^- + \pi^+ + N$?

Background determination with near det.

- The experiment is technically feasible.
Direct costs.

AGS upgrade, Hill, Proton transp., horns,
decay tunnel: $\sim \$150M$

This can be a staged program that starts
with \$90 M at the AGS and \$150 M at
Homestake for first critical results.

- The detector has applications far beyond
accelerator neutrinos. And should have a very
diverse and rich physics program.
Detector: \$300 M for 10% PMT coverage ?
If water Cherenkov cannot have the needed
performance then what ?

Very long baselines with a superbeam

Two possibilities

- 1) Increase AGS to 2 MW by going to 5 Hz operation
- 2) Make finer grain detector at 100 kT. Use all events.

Optimization of the detector and accelerator needs much more detailed simulation study.
